EXECUTIVE SUMMARY

The City of Culver City (City) straddles the Ballona Creek and dips a toe into the Marina Del Rey watershed. When it rains, surface runoff drains into the concrete-lined banks of the Ballona Creek by a network of underground storm drain pipes and channels. This system is referred to as the municipal separate storm sewer system (MS4).

The federal Clean Water Act establishes the National Pollutant Discharge Elimination System (NPDES) permit program, regulated by the State and Regional Water Boards, to control discharge of pollutants into waters of the United State (US). The City is a permittee of the 2012 Los Angeles MS4 Permit (Order NO. R4-2012-0175; NPDES Permit No. CAS004001). These federal and state regulations establish beneficial uses and then water quality targets to prevent water bodies from becoming impaired by specific pollutants and/or to address such impairments. These pollutant load limits and the timelines to achieve them are referred to as total maximum daily loads (TMDLs). The Ballona Creek Watershed is subject to TMDLs for metals and bacteria (among numerous others), both of which require full compliance by 2021. Elevated levels of metal negatively impact aquatic life, and elevated levels of bacteria can pose potential health risks to humans. Both pollutants negatively impact the beneficial uses identified for the receiving water, Ballona Creek.

The City is a member of the Ballona Creek Enhanced Watershed Management Program (BC EWMP), as well as the Marina Del Rey Enhanced Watershed Management Program (Mdr EWMP), both adopted by the Los Angeles Regional Water Quality Control Board (RWQCB) as MS4 Permit compliance pathways. The EWMPs provide guidance for the watershed on how to achieve stormwater quality goals, as well as general guidance for the City. However, a more specific strategy is required to plan, design, and construct water quality projects in the City to meet water quality goals efficiently.

The City has developed a Stormwater Quality Master Plan (SWQMP) to guide proposed actions for compliance with the MS4 permit and EWMPs, and ultimately achieve the TMDL requirements that drive these regulations. To meet compliance goals set by the Mdr EWMP, one project is currently in design and will soon be constructed. Therefore, this SWQMP addresses the Ballona Creek watershed. This plan is intended to be used as a custom compliance tool for the City to achieve stormwater quality goals efficiently, identify and prioritize projects, maximize funding opportunities, and engage with the community, stakeholders, and potential project partners.

ES.1 Stormwater Quality Goals

A Reasonable Assurance Analysis (RAA) was completed as part of the BC EWMP to demonstrate that the proposed best management practice (BMP) approach will achieve water quality goals. The RAA simplified the water quality targets for numerous pollutants derived from applicable TMDLs to “limiting pollutants”, or pollutants that require the most treatment to address. By achieving the water quality targets for these limiting pollutants, control of the other pollutants can be demonstrated. The RAA showed that zinc and *Escherichia coli* (*E. coli*) were the limiting pollutants for the Ballona Creek Watershed because they would require the largest structural control measures by capacity:

1. 50 percent compliance for Ballona Creek Metals TMDL by 2016 (\$21 million)
2. 100 percent compliance for Ballona Creek Metals TMDL by 2021 (\$96 million)

3. 10 percent compliance for Ballona Creek Bacteria TMDL by 2021 (\$21 million)

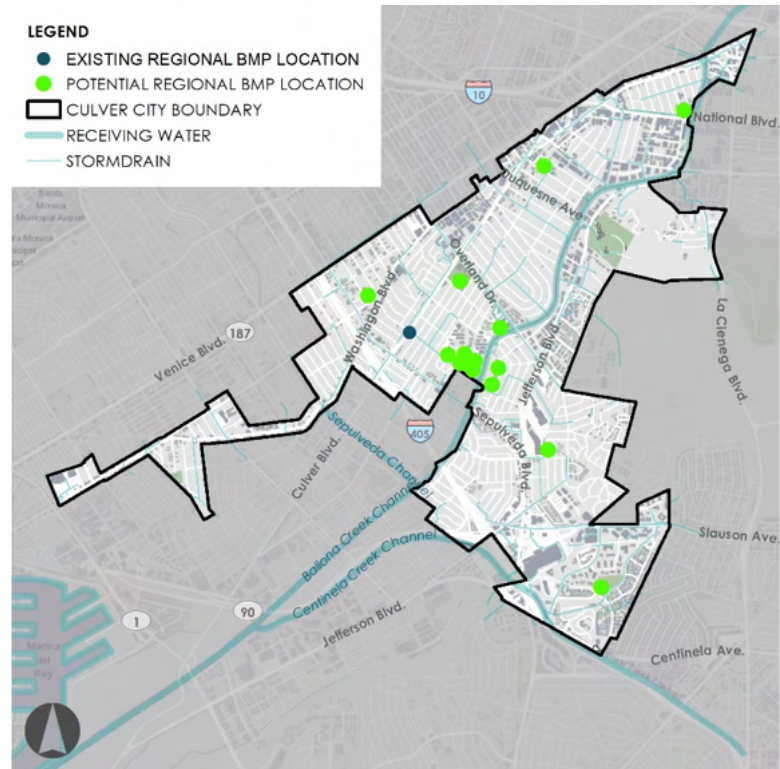

The BC EWMP also included an Implementation Strategy for each City with a prescribed set BMPs such as Low Impact Development (LID), green streets, and regional projects. The primary measure of EWMP implementation is volume of stormwater managed by the BMPs. The BC EWMP determined that a combined BMP capacity of 99 acre-feet (ac-ft) for the prescribed set of BMPs would provide reasonable assurance that water quality goals are met in the City.

ES.2 Stormwater Quality Project Identification & Prioritization

The purpose of the SWQMP was to merge various factors that span city-specific interests, physical characteristics, and water quality goals to identify priority structural BMP projects. Measurable metrics for each factor were developed, and each project was scored accordingly. Projects that scored the highest are Priority Projects. Identified projects fall into one of the three following categories:

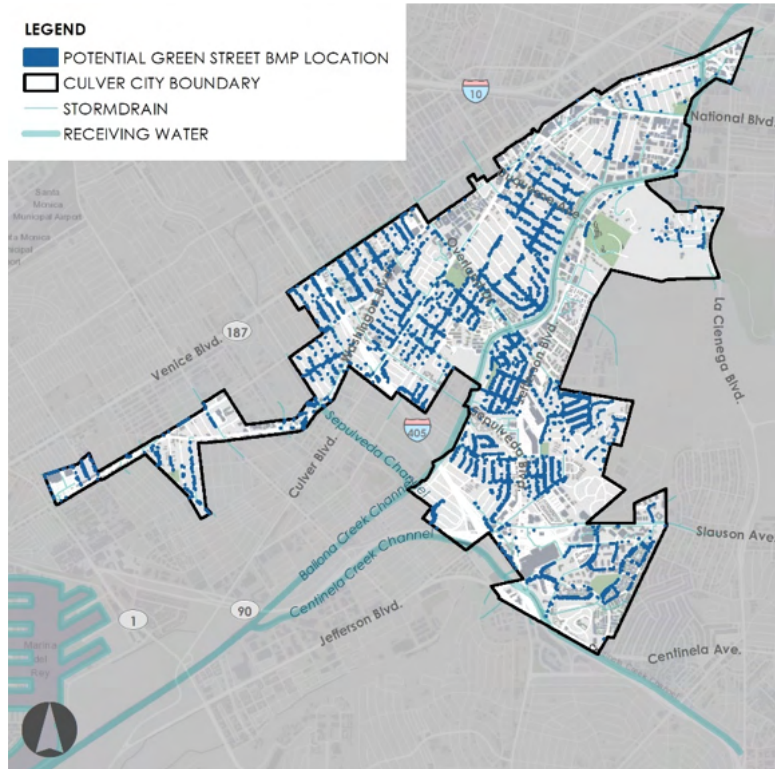

Regional Projects are centralized facilities often located in the downstream portion of a watershed. They are designed to receive large volumes of runoff, typically diverted from storm drainpipes upstream of the receiving water body. These BMPs can be large basins or underground vaults. Due to the larger volumes of these facilities, regional projects are typically the most cost-effective solution for treating surface runoff.

Because the City spans Ballona Creek on both sides, there are multiple natural low points at the downstream portion of several watersheds that drain to the creek. The SWQMP study identified City parks and schools as potential regional project locations. Of these, eight parks and school locations were identified as top ten priority projects based on physical and infrastructure characteristics of the project location as well as the volume of stormwater potentially treated.

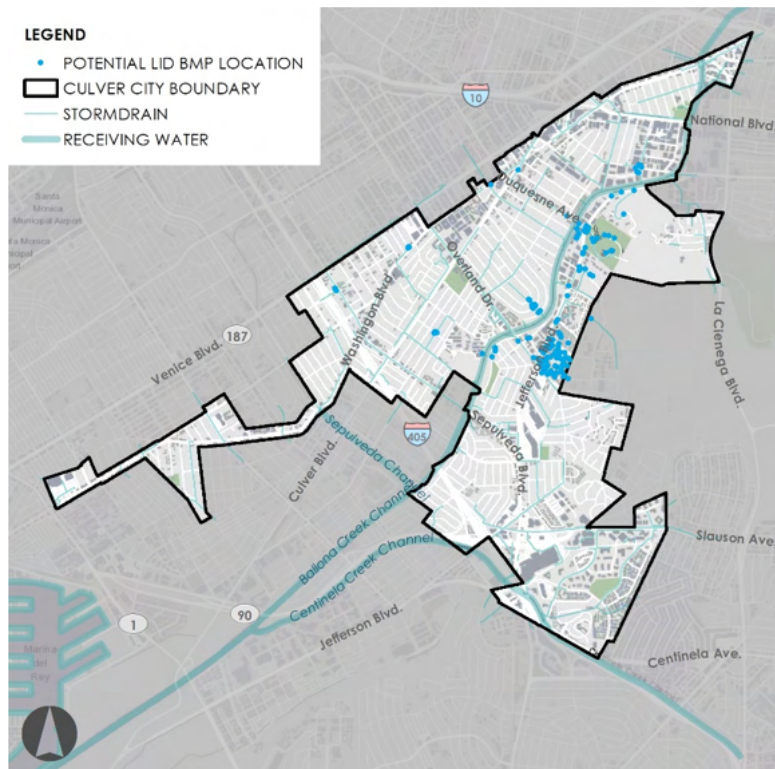

Green Street Projects are distributed, small scale BMPs such as bioretention and biofiltration areas located along roadways. They can be designed to receive surface runoff from the public right of way via curb cut outs and infiltrate through planted media. These BMPs can provide water quality benefits as well as pedestrian safety, traffic calming, street tree canopy, and other “complete streets” benefits.

The SWQMP identified ideal locations for green street BMPs on a neighborhood and street scale throughout the City.

Low Impact Development (LID) Projects are distributed, smaller scale BMPs that capture, infiltrate, harvest and use, or treat runoff on a parcel level. They are designed to receive surface runoff from either the surface directly or diversion from storm drain pipes. Examples generally include rainwater cisterns, rain gardens, permeable pavements, and infiltration BMPs.

For the SWQMP, dry wells were selected as the most efficient LID BMP, intended for space limited locations where green street projects and regional projects were infeasible. Ideal locations for dry wells were sited throughout the city. These BMPs can also supplement infiltration of larger regional BMPs as well as green street projects.

Other BMPs The three major types of BMPs were identified for the City in this SWQMP. This does not mean that other types of BMPs are not appropriate for specific sites. For instance, elements of LID are incorporated into the concept plans for the potential

regional projects, such as harvest and use, dry well infiltration supplementation, and permeable pavements.

Additionally, the assumptions used in the SWQMP study for site suitability include infiltration rates based on available soil data. Infiltration is an ideal form of stormwater treatment because it is both cost and treatment effective; however, it is highly variable and site specific. Geotechnical investigations will determine site specific feasibility for infiltration when concept projects are pushed forward into project design. In cases where regional project locations have higher than expected groundwater or lower than expected infiltration rates, an alternative option to divert stored stormwater to sanitary sewers may be considered. Diversion to sanitary sewers is less cost effective than infiltration; however, it does provide alternative water supply and drought resiliency benefits.

Project Identification Based on the BC EWMP analysis, reaching the combined BMP capacity of 98.7 acre-feet (ac-ft) was not possible on publicly owned land alone. The BC EWMP shows that a majority of the 98.7 ac-ft required for City compliance was identified to be regional BMPs on private land; projects and locations which have not yet been identified. In total, 43 ac-ft of capacity of LID and green street BMPs was specified on public land and one public regional BMP project with 5 ac-ft of capacity.

To increase compliance feasibility, the SWQMP study compiled data on a more granular city scale in an effort to identify additional structural BMP opportunities on publicly owned land with multiple benefits to the City. A total of 69.2 ac-ft of structural BMP capacity was identified on public land, with 40 ac-ft of potential capacity in ten public regional projects. Figure 1-1 summarizes the results of the SWQMP study and compares them to BC EWMP identified BMPs.

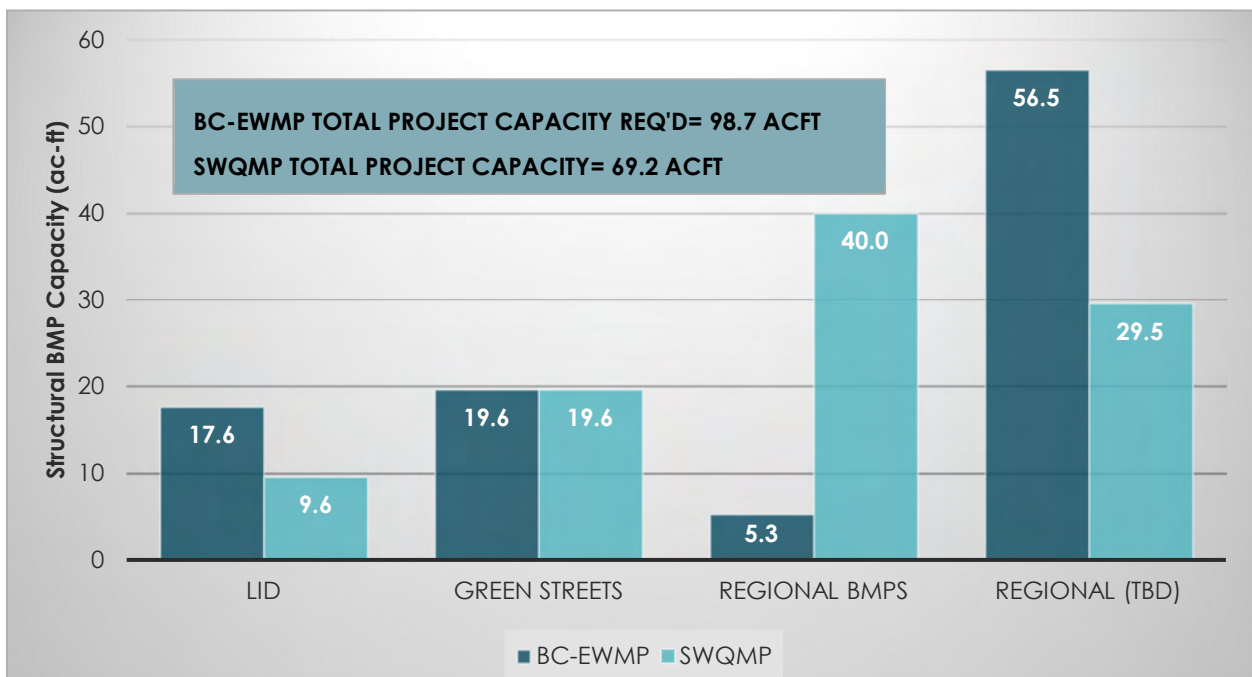

Figure 1-1: SWQMP BMP Structural Capacity Summary

Project Prioritization The SWQMP analysis identified 441 regional, green street, and LID projects. Projects were then individually scored in three key metric categories: site suitability, multi-benefit, and EWMP equivalent volume. Each project was modeled in Watershed Reporting Adaptive Management and Planning System (WRAMPS), which is currently used by the City to provide estimates of stormwater volume managed and progress towards meeting EWMP water quality goals in annual reporting. This tool also provides a planning cost estimate for each project, consistent with the costs reported in the BC EWMP.

Two prioritization scenarios were defined by the City for their stormwater quality capital improvement plan:

1. Scenario 1 – Projects were prioritized by expected available funding for the next ten years using planning level costs as a guide for a realistic implementation plan.
2. Scenario 2 – Projects were prioritized by expected EWMP equivalent volume as a guide to achieve water quality goals expeditiously.

The prioritization process generated a third scenario. Scenario 3 reflects the projects ranked by score. Scenario 3 is intended to be used to identify grant-competitive projects that best represent multi-benefit and compliance target progress potential.

Additionally, a web-based dashboard was developed as a tool for the City to track progress, modify projects as they are designed and completed, add projects in the future, and identify projects that may not have been prioritized in either scenarios described above, but may become more appealing as funding is obtained, private projects are proposed, or other conditions change.

ES.3 Funding Opportunities & Engagement

Meeting stormwater quality goals is an expensive endeavor – the BC EWMP estimated that it would cost \$138 million to achieve full compliance. The Clean Water, Clean Beach Parcel Tax (Measure CW) was passed by Culver City residents during the November 8, 2016 Special Municipal Election. The Los Angeles County Safe Clean Water Program Parcel Tax (Measure W) was passed in the November 2018 election. The total dedicated funding to the City for stormwater quality work from these sources is approximately \$2.75 million annually.

Several other stormwater quality-focused funding opportunities exist. For example, a component of the Safe Clean Water Program is that projects can be submitted for regional funding based on specific multi-benefit and water quality criteria. Other sources of funding focus on climate change, sustainability, and resiliency. Prioritization metrics were chosen with intention to fit different applications for alternative funding opportunities. The focus of the SWQMP was existing Measure W and Prop 1 funding opportunities. However, each project identified in this SWQMP was assigned a score based on measurable metrics, and the projects can be prioritized by the City to choose the most appropriate projects for other targeted grant opportunities.

As a starting point, the SWQMP developed concept plans for the top priority projects identified in the analysis. These concept plans include the compiled information from the analysis, as well as a design concept to be used by the City to obtain grant funding. These concept plans are intended to be further developed and implemented when funding becomes available.

The concept plans are also a valuable tool for use with community or stakeholder engagement, as well as project partnerships. With specific project locations and concept designs in place, the City will be well equipped to begin discussions with the Culver City Unified School District, City Council, private developers, and public in outreach settings.

1 INTRODUCTION

The development of this SWQMP was data intensive; data were compiled, generated, and analyzed to identify the best projects for the City in different scenarios. Ultimately, the data is most useful in resulting Concept Plans and online web dashboard format, where the City can visualize and manipulate the information for planning and communication purposes.

This SWQMP contains data collection and processing, project identification, concept plan development, stakeholder coordination, a workplan for how the information can be used for future and prioritized projects, and the Public Outreach Plan (POP).

2 DATA COLLECTION AND PROCESSING

Data collection was the key to identifying feasible project locations for the city and creating a useful database for the web viewer. Data were obtained from various sources, inventoried, assessed, and translated as summarized in the following sections. The data inventory is provided in Appendix A.

2.1 Site Suitability & Physical Project Siting Data

The following information was used to identify potential project locations or measure site suitability.

2.1.1 Ground Surface

The ground surface digital elevation model (DEM) raster was provided by the City. The City obtained this raster dataset (LARIAC4_SLDS.gdb) from the Los Angeles Region Imagery Acquisition Consortium (LARIAC). The DEM contains light detection and ranging (LiDAR)-derived elevation data flown from 10 October 2015 to 19 November 2015.

2.1.2 Slope

Slope information was obtained through the LARIAC data for the DEM.

2.1.3 Flow Concentration

LARIAC buildings, edge of pavement, inlets, storm drain laterals and mains, and the Ballona Creek were “burned” into the DEM. Burning this data elevated or lowered the surface elevation to show how runoff will move through the City. Esri’s ArcHydro tools were then used to determine how flow concentrates across the City.

2.1.4 Drainage Area Delineation

The drainage areas were created using Esri’s ArcHydro tools. The flow concentration threshold determined the maximum size of the catchment drainage area. The smaller the threshold, the larger number of catchment drainage areas were returned. Michael Baker generated multiple drainage area sizes, the smallest being 0.25 acre for the threshold size.

2.1.5 Land Uses & Imperviousness

The City’s geographic information system (GIS) land use data were downloaded from the City’s website. Each land use type was assigned a percent impervious value based on County of Los Angeles’ Hydrology Manual Appendix D, with minor adjustments to accommodate the specific land uses in the City (Table 2-1). The imperviousness of a drainage area was then calculated to be the weighted average for the catchment area.

Table 2-1: Land Use Summary

| Code | Los Angeles County Land Use | Culver City Land Use | LA County % Impervious | City % Impervious |
|---------|---|---|------------------------|-------------------|
| 1112 | Low Density Single Family Residential | Low Density Single Family Residential | 21 | 50 |
| 1122 | Duplexes, Triplexes and 2-or 3-Unit Condominiums and Townhouses | Low Density Two Family/ Low Density Three Family | 55 | 70 |
| 1123 | Low-Rise Apartments, Condos, and Townhouses | Low Density Multi Family | 86 | Same |
| 1125 | High Rise Apartments and Condos | Medium Density Multi Family | 90 | Same |
| 1140 | Mixed Residential | Planned Residential Development | 59 | Same |
| 1211 | Low and Medium Rise Major Office Use | Downtown/ Institutional/ Studio | 91 | Same |
| 1221 | Regional Shopping Center | Regional Center | 95 | Same |
| 1232 | Commercial Recreation | Community Serving Center | 90 | Same |
| 1241 | Government Offices | Government Offices | 91 | Same |

| 1262 | Elementary Schools | Elementary Schools | 82 | Same |
| 1263 | Junior or Intermediate High Schools | Junior or Intermediate High Schools | 82 | Same |
| 1264 | Senior High Schools | Senior High Schools | 82 | Same |
| 1460.03 | Mixed Utility and Transportation-Freeways and Major Roads | Streets and Roads | 91 | Same |
| 1500 | Mixed Commercial and Industrial | Industrial/Light Industrial/ Industrial Park | 91 | Same |
| 1840 | Cemeteries | Cemeteries | 10 | Same |
| 1880 | Other Open Space Recreation | Other Open Space Recreation | 10 | Same |
| NA | NA | General Corridor | NA | 96 |

2.1.6 Vegetated Areas

LARIAC infrared imagery data were used to identify open space areas with a focus on vegetation and soil. In addition to identifying areas with vegetation, it was also used to screen out areas with established trees. A deep red color indicated the presence of trees. A light red color indicated areas of grassy open space. Areas without a red color indicated buildings or streets (see Figure 2-1).

Figure 2-1: LARIAC Imagery Data Showing Vegetation and Open Space

2.1.7 Groundwater

Using well information collected from the State Water Resources Control Board (SWRCB) GeoTracker data, well locations were geolocated and conservatively assigned the highest groundwater depth from historical data. A city-wide groundwater surface raster was generated from the well data-points.

2.1.8 Soil Type and Hydrologic Soil Group

Los Angeles County soils data is based on a numeric classification system. A conversion process to NRCS Hydrologic Soil Groups (HSG) types was developed based on the soil description of the various numeric types identified in the City. Soils with sand, loam sand, and sandy loam characteristics were identified as Group A; soils with silt loam and loam characteristics as Group B; soils with sandy clay loam characteristics as Group C; and soils with clay loam, silty clay loam, sandy clay, silty clay, and clay characteristics as Group D. See Table 2-2.

Table 2-2: Hydrologic Soil Group Types in Los Angeles County

| Los Angeles Soil Number | Los Angeles County Soil Name | Original Name | Hydrologic Soil Group |
|-------------------------|------------------------------|---------------|-----------------------|
| 3 | Chino Silt Loam | CS-1 | B |
| 6 | Hanford Fine Sandy Loam | HF-1 | A |
| 9 | Montezuma Clay Adobe | M | D |
| 10 | Oakley Fine Sand | OS | A |
| 13 | Ramona Loam | RO | B |
| 16 | Yolo Loam | Y | B |
| 17 | Yolo Clay Loam | YC | C |
| 20 | Yolo Sandy Loam | YS | A |

2.1.9 Storm Drain

The City provided the storm drain system in a geodatabase format, which was compared to and merged with data from the Los Angeles County storm drain geodatabase. Where the County had additional storm drain information, the City's storm drain geodatabase was updated for completeness.

2.1.10 Sanitary Sewer

The City provided the sanitary sewer system in a geodatabase format.

2.1.11 Other Major Utilities

Gas main lines and rail lines were mapped to identify major utility conflicts with proposed BMP projects.

2.1.12 Environmental Cleanup Data

Leaking underground storage tank/leaking underground fuel tank (LUST/LUFT) cleanup, cleanup program sites (CPS), spills-leaks-investigations-cleanup (SLIC), and land disposal sites were obtained from the SWRCB GeoTracker data. The data were mapped to consider proximity to BMP opportunities.

2.2 Multiple Benefit Data

The following information was compiled to identify projects with potential multiple benefits. Priority projects with multiple benefits were considered in more detail in the concept planning phase of the SWQMP.

2.2.1 Planned Capital Improvement Projects

The City Five-Year Capital Improvement Plan, Fiscal Years 2019, 2020 to 2023, and 2024 and the Parks and Recreation Facilities Facility Condition Assessment Report (January 2008) were provided. Specific project locations were mapped for use in determining potential project co-location.

2.2.2 Planned Private Improvement Projects

The City provided a list of planned private improvement projects. Specific project locations were mapped for use in determining potential project co-location or project partnerships.

2.2.3 Groundwater Aquifer

Groundwater aquifer data were obtained from Los Angeles County and used to determine if there was an opportunity to augment water supply. The City is located within the Santa Monica, Central, and West Basins. Each are considered confined aquifers and therefore, recharge opportunities from the surface are limited.

2.2.4 Localized Flooding Areas

Based on conversations with the City, localized flooding is rare. The City provided known locations, which were mapped for use in determining potential project co-locations.

This metric could be used to determine multiple benefits in the future, if more localized flooding issues arise or are identified based on additional urban flooding analysis.

2.2.5 Disadvantaged Communities

Disadvantaged communities in or around the City were mapped based on information from the California Office of Environmental Health Hazard Assessment (OEHHA) website (<https://oehha.ca.gov/calenviroscreen/sb535>).

2.2.6 Urban Heat Island Index

The California Environmental Protection Agency's urban heat island index (UHII) data were used to measure BMP potential to reduce the urban heat island effect.

2.2.7 Ballona Creek Revitalization

A buffer around Ballona Creek was delineated to measure proximity to BMP projects. Proximity was used to determine level of probable multi-benefit projects and flagged for closer consideration in the concept plan.

3 PROJECT IDENTIFICATION

Knowing where to invest limited funding is essential to increase potential return on investment. Customized tools were created to screen potential locations using collected data. The tools developed for the project include a set of rules that screen potential locations based on preferred characteristics for each BMP type. Constraints such as site location, hydraulic head, proximity to utilities, maintenance access, and tributary drainage area are then considered.

The governing factor of BMP feasibility is the hierarchy identified in the MS4 Permit. The order of preference for BMP type is infiltration, harvest and use, bioretention, then biofiltration. The process used for the SWQMP followed this preferred hierarchy.

3.1 Project Location

Potential project locations were identified using land use and parcel ownership data to select publicly owned parcels and right of way. Private parcels were not evaluated as part of this study. Infrared imagery was overlaid to determine areas of open and/or vegetated spaces within the public right of way. A check was performed to verify that those locations were within a reasonable proximity to an existing main storm drain line, to minimize the infrastructure (specifically new storm drain pipe) required to convey runoff to a project site.

Ability to infiltrate was evaluated based on soil type, depth to groundwater, pollutant mobilization, and geotechnical hazards, such as surrounding slopes, as well as potential for landslide and liquefaction.

- For this level of analysis, HSG A and B were assumed to be conducive to infiltration; HSG C and D are assumed to be infeasible for infiltration. Readily available soil data is typical for a planning level study. When preliminary design occurs, additional site-specific geotechnical analysis will be necessary.
- Where infiltration was deemed feasible based on HSG soil type, a minimum depth to groundwater was determined. The minimum depth accounted for 10 feet of separation between an infiltration surface and the seasonal high groundwater level along with sufficient cover for the device. Project locations were screened where groundwater was 18 feet or less below ground surface.
- The groundwater surface was created using available groundwater well data throughout and around the City. The approach was conservative and used the highest recent groundwater levels. Depth was determined by checking the distance between the ground surface and the groundwater surface.
- A ground surface slope of 15 percent was set as a maximum allowable slope to reduce the risk of geotechnical instability.

Areas that were determined infeasible for regional infiltration due to depth to groundwater issues, were next evaluated for local infiltration BMPs in the form of drywells, followed by bioretention. For locations where infiltration was not feasible, biofiltration and regional alternative BMPs (diversion to sewer) were considered.

3.2 Project Drainage Area and Runoff Volume

After BMP locations were set, a script was written to determine the BMP drainage area. This included tributary area to the location via surface drainage and the storm drain system. This process used the ground surface created from the LARIAC data and the

micro-catchments created throughout the watersheds. The drainage area identification tool uses the catchment ID information to identify each upstream drainage area and groups them together.

For each drainage area, a weighted average impervious value was calculated using the land use type and its associated imperviousness. A slope was calculated using the ground surface and the surface flow path was measured (a maximum of 1,500 feet was assumed). HydroCalc, the Los Angeles County Department of Public Works developed program, was used to compute the stormwater quality design volume (SWQDv) for the 85th percentile, 24-hour storm event.

3.3 Project Capacity

Preliminary regional infiltration BMP volumes were first assumed to accommodate the entire SWQDv. Where regional BMPs were limited by site constraints, capacities were estimated using the maximum footprint available at each BMP location and the maximum possible depth of the infiltration gallery. Estimated infiltration rates were then used based on soil type to estimate maximum ponding depths that would comply with vector control requirements. Additional features may be added to the regional infiltration systems to resolve concerns about a longer drawdown time than the allowable 96 hours. This may include incorporating bubblers and aeration systems to mitigate for the risk of standing water and vector concerns.

Reasonable assumptions for dry well capacity were made based on consultation with a local dry well manufacturer with experience throughout Los Angeles County. Dry well capacity was determined based on a conservative expected treatment flow rate of 0.1 cubic feet per second (cfs), in combination with the assumption that one dry well could address runoff from up to five acres of developed area. Both values are appropriate for a planning study.

Green street bioretention and biofiltration volumes were calculated based on the geometry of the available cross section area. A unit area per linear foot of parkway width was developed based on the local LID guidance manual and City green street standards. Each applicable section was then applied to the available length to calculate the potential volume. Due to the relatively small volume capacity of individual bioretention and biofiltration systems, they were grouped by neighborhood, storm drain line, and street. Each street is considered as one project with the total treatment volume calculated as the sum of the individual systems. Consolidation of green street opportunities allows these BMPs to be evaluated and implemented on a larger scale, while also providing the City with manageable co-location opportunities during street improvement projects.

4 PROJECT PRIORITIZATION METHODOLOGY

As described in Section 3, an analysis was conducted to identify all potential opportunities for stormwater projects throughout the City. The prioritization builds upon this process by overlaying the multiple datasets to evaluate characteristics for site suitability (both feasibility and effectiveness), as well as multiple benefits that, while not the primary goal of stormwater projects, provide other reasons for implementing and funding these projects. The result of the prioritization process is a list of ranked potential project sites that serves as the basis for the City's implementation plan described in Section 7. In addition to guiding the implementation strategy, the output from the prioritization process can be used as a tool to understand the costs and benefits of the identified opportunities and to serve as a starting point for the assessment of future candidate projects as they arise.

4.1 Project Types

The project identification process sorted project opportunities into three types: regional stormwater capture, dry wells, and green street (bioretention/biofiltration) projects. Due to the differences in site characteristics that are conducive to these three project types, a separate set of metrics for site suitability were developed for each project type. However, the metrics related to multiple benefits or EWMP progress were applied equally to all three project types. Due to the differences in constraints, advantages, and situations in which one would select a specific project type, these categories were evaluated separately and prioritized only in comparison to other project opportunities within the same category. The three categories are explained in further detail below.

Regional stormwater capture projects are large-scale centralized facilities that capture and treat stormwater from a large drainage area by diverting from a nearby storm drain or channel. Regional projects typically treat stormwater runoff from both on-site (from the same parcel as the project) and off-site. Off-site runoff is typically routed to the project site via a diversion structure from storm drains, channels, or streams and may require pump stations. Regional projects can be designed for both subsurface (e.g., infiltration chamber) and above ground (e.g., detention, constructed wetlands) applications. Due to the space limitations in the highly urban landscape of the City, the regional projects identified in the SWQMP are assumed to be subsurface infiltration chambers. These types of facilities have the advantage of either retaining their pre-construction use or serving some improved recreational purpose after construction is completed. For example, many subsurface stormwater facilities constructed to date are placed below open fields at public parks where, upon project completion, recreational uses are restored or improved recreational facilities are included as part of the project design. Regional projects may treat captured runoff through a variety of mechanisms, including infiltration of treated runoff into native soils, through the release of treated runoff to the back to the storm drain, or storage for non-potable use like irrigation. The benefits of regional projects may include flood attenuation, groundwater recharge, pollutant reduction, and water supply augmentation. They are often the most cost-effective projects due to the multiple benefits achieved and the economies of scale. The site characteristics and land uses will determine what types of regional projects are feasible, e.g., how much flow the project can divert from the storm drain network, whether the project is above ground or underground, and the potential size of the project.

Dry wells are a type of stormwater capture project that capture and treat stormwater runoff through deep infiltration into underlying groundwater aquifers. Dry wells often benefit from increased infiltration rates compared to other infiltrating stormwater projects due to the bypass of surficial soils into deeper soil layers with greater infiltration capacity. However, because some of the natural filtration provided by surficial soils is lost, pretreatment of captured runoff is almost always required before directing runoff to a dry well. Dry wells are typically considered for on-site treatment, since larger drainage areas tend to generate more sediment in runoff that presents risk of clogging and failure of the dry well.

Green street projects are stormwater projects implemented linearly along the public right-of-way. Green streets typically capture runoff from the street and runoff from adjacent impervious surfaces (e.g., driveways, sidewalks, and roof downspouts). Green streets are distributed, small-scale stormwater projects spread throughout an urban area that provide localized treatment and localized flood reduction for relatively small drainage areas. For example, green streets can include facilities such as bioretention bulb-outs, stormwater planters (Figure 4-2), or permeable pavers along street rights-of-way. In the SWQMP, this category of projects is considered either bioretention or biofiltration. Bioretention projects capture and infiltrate runoff when native soil infiltration rates are adequate. Where infiltration rates are too low to efficiently drain a bioretention facility, a biofiltration facility, which includes an underdrain with a connection to the storm drain system, is used instead. In a biofiltration facility, captured runoff is filtered through the engineered soil media and allowed to exit the system through the underdrain.

Figure 4-1: A green street with bioretention implemented in the right-of-way (Fashion District, Los Angeles).

4.2 Prioritization Metrics

The selected metrics for project prioritization were organized into three categories: site suitability, multi-benefits, and EWMP equivalent volume. Each metric received a score based on specified ranges. The score in each category was normalized by taking the average of the metrics within each category – each project received a score between 0 to 5 in each of the three categories. The final prioritization score for a project opportunity was derived by summing the score for each category (out of 15 total points). Figures 5-5 through 5-7 at the end of this chapter present the criteria used for each project type to assign scores for each metric. The metrics used in the analysis are described in detail below.

4.2.1 Site Suitability Metrics

Site suitability metrics are related to indicators of the available opportunity (maximum drainage areas or footprints), utility constraints, or indicators of potential project effectiveness. For example, imperviousness, parcel size, and land use may be considered surrogate indicators for the available opportunity (e.g., runoff-generating potential, available footprint, compatibility with current site use). Hydrologic soil group and slope

may be considered surrogate indicators of project effectiveness (e.g., infiltration capacity, prohibitive constraints, design challenges).

4.2.1.1 Drainage Area

Drainage areas were delineated for regional and dry well projects during identification of potential opportunities. The size of the drainage area is considered an indicator of runoff-generating potential, and therefore, stormwater capture effectiveness. The amount of runoff diverted to a project for any given storm event is highly correlated to the size of the drainage area, especially impervious area. Regional and dry well projects with larger drainage areas are given more points in this category. Green street drainage areas were not delineated due to their distributed, small-scale nature and the need for site-specific topographical survey data that is typically not collected until the design stage.

4.2.1.2 Slope

Average site slope was evaluated for all projects. Projects situated on steep slopes present challenges with construction and effectiveness. Steep slopes typically generate greater runoff rates that are more difficult to divert, complicate the design of inlet structures, and result in more expensive projects. Projects with milder slopes are given more points in this category.

4.2.1.3 Proximity to Storm Drain

Regional projects most often divert runoff from the storm drain or another conveyance network like a stream or channel to treat large drainage areas. The cost of diverting or pumping increases with the distance needed to convey runoff to the project site. Additionally, overflow and outlet structures that allow the facility to be drained for maintenance or emergency reasons benefit from being located near a storm drain. Regional project opportunities that are closer to a storm drain are given more points in this category.

4.2.1.4 Imperviousness

Imperviousness was evaluated for regional and dry well projects. Green streets were not evaluated for this metric since green street drainage areas were not delineated. Impervious area is associated with greater stormwater runoff. Additionally, many of the pollutants in stormwater runoff are associated with highly impervious urban areas. Because the primary goal of the SWQMP is to treat and reduce pollutants in stormwater runoff, opportunities that have drainage areas with greater imperviousness are given more points in this category.

4.2.1.5 Hydrologic Soil Group

The Hydrologic Soil Group was evaluated for all three project types to prioritize sites that sit on well-drained soils. Group A represents the most well-drained soils, and Group D represents the least well-drained soils. Since infiltration is a common treatment mechanism of stormwater capture, the highest priority was given to Soil Group A, with each subsequent group assigned fewer points.

4.2.1.6 Width of the Right-of-Way

Right-of-way width is used to evaluate the amount of area that may be available for green street retrofits. Public right-of-way typically serves multiple uses (e.g., pedestrian

walkways, bicycle lanes, transit loading zones, parking, etc.), and can be space constrained. Street segments that are in wider rights-of-way are more likely to be able to support a bioretention or biofiltration footprint. Green street opportunities on street segments with a wider right-of-way were given more points in this category. Width is often a function of street classification (i.e., arterial streets tend to be wider than residential streets). To avoid penalizing projects along local streets, street segments were first bracketed into street class (arterial, collector, and local) and sorted into the widest third, middle third, and narrowest third of segments by street class. The widest street segments in each class were given the most points in this category.

4.2.1.7 Utility Conflicts

Utility conflicts are an important factor for the feasibility of most stormwater projects. Large utilities are often cost-prohibitive or infeasible to relocate or design around. This is especially true for small-scale projects like green streets, where the smaller benefit may not justify the cost of relocating utilities. Green street projects along streets with one or more high conflict utilities present were given fewer points in this category. High conflict utilities included major gas transmission lines, trunk sewer lines, rail lines, and tunnels.

4.2.1.8 Within Drainage Area of Another Proposed Project

Several opportunities fall within the larger drainage area of another proposed project because green street and dry well opportunities are widely distributed across the city. These sites can be treated by a larger downstream centralized facility, where treatment would likely be more cost-effective. Project opportunities that fall within a larger project drainage area were given fewer points.

4.2.2 Multi-Benefit Metrics

4.2.2.1 In Neighborhoods with Localized Flood Issues

Stormwater projects provide the benefit of reduced frequency and magnitude of localized flooding issues. Stormwater projects typically reduce the volume of water and flow rates of flood events. Projects within the neighborhoods identified by the City as experiencing frequent nuisance flooding were given more points in this category.

4.2.2.2 Private Development Project Within Project Drainage Area

Private developers within the City are required to implement LID to manage runoff from on-site. However, if private development occurs upstream of a planned public stormwater project, there could be opportunities to partner with developers to help fund the construction of a downstream project in lieu of implementing LID on-site. Projects with drainage areas that contain upcoming planned private development projects were given more points in this category.

4.2.2.3 Pollutant Source Areas

Certain land uses are typically associated with higher concentrations of stormwater pollutants. A study by the Southern California Coastal Water Research Project (SCCWRP 2007) evaluated the event mean pollutant concentrations of pollutants in runoff sampled from specific land uses. The report identified industrial land use as exhibiting the highest zinc concentrations, followed by commercial, high-density residential, transportation, and low-density residential land uses. Figure 4-2 depicts the event mean concentrations (EMCs) for zinc from the SCCWRP technical report. Zinc concentrations were evaluated for this metric since zinc is one of the limiting pollutants identified in the Ballona Creek EWMP. Points were assigned using the land use with the highest zinc EMC that represented at least 10 percent of the project's drainage area.

Figure 4-2. Mean storm EMCs of total zinc at specific land use sites during the 2000/01-2004/05 storm seasons (SCCWRP 2007).

4.2.2.4 Co-located Planned Projects

Co-locating stormwater capture projects with other capital improvement projects increases opportunities for cost-sharing and maximizes multiple benefits that may not otherwise be achieved by a single project. Project opportunities that could be implemented in parallel with an identified City capital improvement project currently in the planning phase were given more points in this category. A total of 24 City projects were identified from the capital improvement project list. Projects were considered co-located with another City project if the parcel or street segment is within 500 feet of one of the other City projects. A list of the other City projects evaluated for co-location is presented in Figure 4-3.

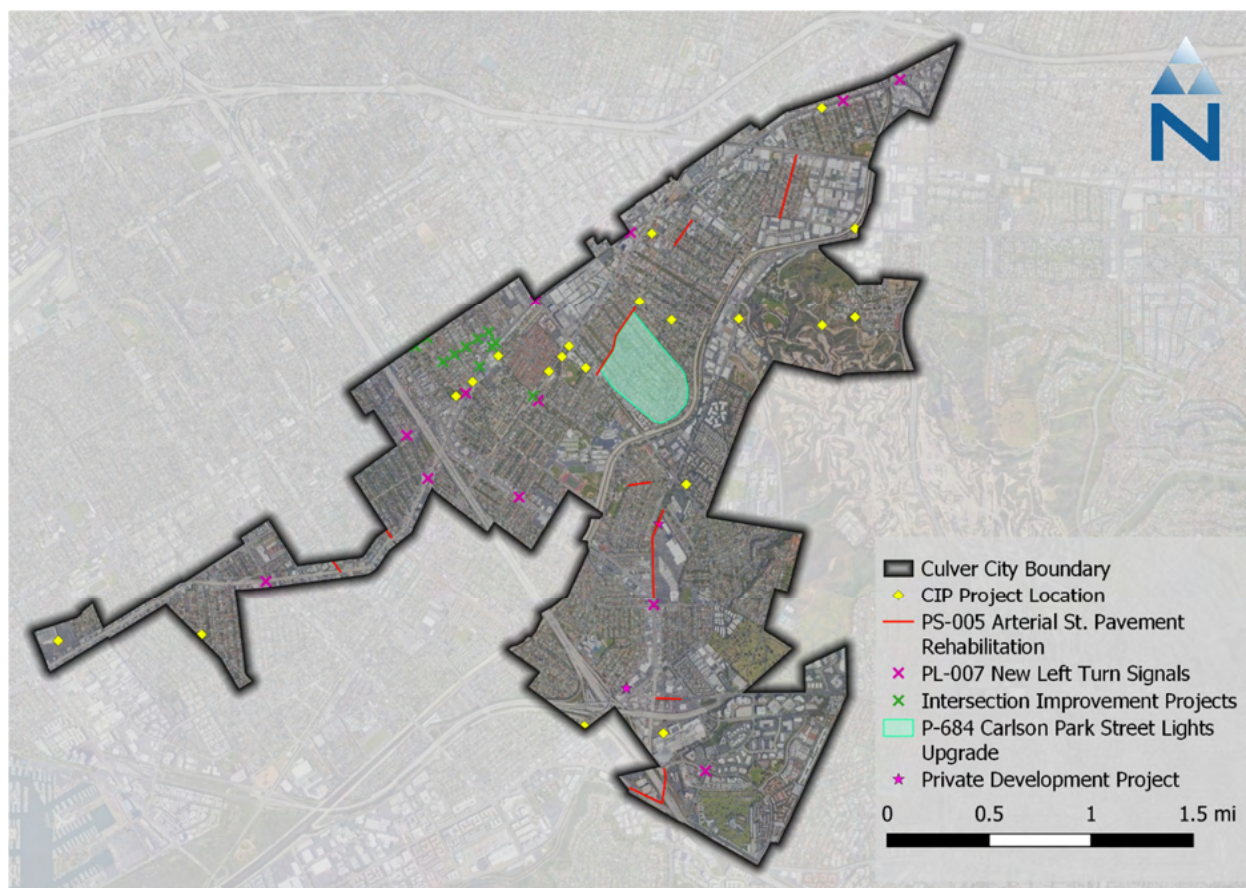

Figure 4-3. Capital improvement and other planned projects for co-location of stormwater BMPs.

4.2.2.5 Groundwater Constraints

Infiltration stormwater BMPs must maintain a specified distance from the groundwater table to ensure proper drainage of the facility. Sites with groundwater separation (the distance between the groundwater table and the ground surface) of at least 20 feet were given the most points in this category. Sites with groundwater separation of 10 to 20 feet were given fewer points. Sites with less than 10 feet of separation were given the fewest points. Since infiltration BMPs have the potential to mobilize pollutants already present in groundwater, a project was also given the fewest points if it was located within 500 feet of an active groundwater contamination cleanup site from the GeoTracker database.

4.2.2.6 Disadvantaged Community Benefit

A project was considered a benefit to a disadvantaged community if located within or near a disadvantaged community as defined by California Senate Bill (SB) 535 or a Low-Income Community as defined by California Assembly Bill (AB) 1550. SB 535 and AB 1550 identify priority populations that may be disproportionately burdened by the challenges presented by climate change and pollution-related issues. Projects located within one of these communities were given the most points in this category. Projects considered to be within the sphere of influence of these communities (defined as 500 feet) were still considered a benefit to these communities and given points in this category. Figure 4-4 shows a map of the disadvantaged communities across the City.

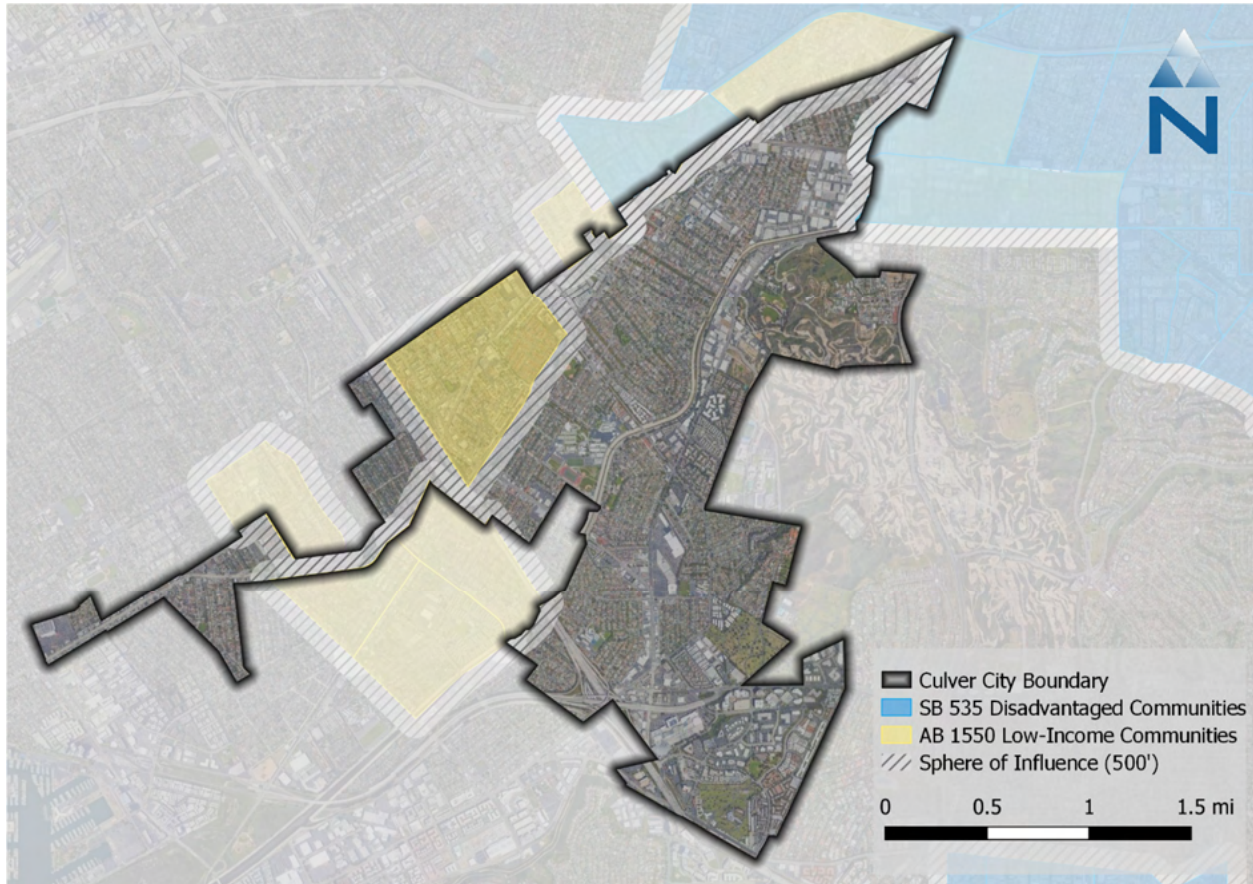

Figure 4-4. Disadvantaged communities (SB 535 & AB 1550) in and near Culver City.

4.2.2.7 Urban Heat Island Index

One common benefit associated with stormwater BMPs is increased greenery in urban areas, especially for vegetated practices like bioretention and biofiltration. Associated benefits include beautification of neighborhoods, increased shading, and reduced urban heat island effect. The California Environmental Protection Agency's urban heat island index (UHII) was used to prioritize projects (CalEPA 2015). Projects in census tracts with higher UHII values, where the urban heat island effect is determined to be the greatest were given the most points in this category.

4.2.2.8 Ballona Creek Revitalization

The 2016-2020 and 2018-2023 Strategic Plans adopted by the City Council incorporated as one of its goals the enhancement and restoration of Ballona Creek as a sustainable, walkable, bikeable, and connected recreational attraction. Stormwater projects can be implemented with these design elements in mind. Many vegetated BMPs integrated along pathways (bioretention curb extensions, stormwater tree wells, etc.) have been shown to improve pedestrian and biker safety, add urban greenery, and encourage non-automotive use. Additionally, site improvements often implemented after construction of larger regional projects (e.g., new ballfields, playgrounds, track) can serve as community features that provide destinations for recreational use along the Ballona Creek corridor. Projects within 50 feet of Ballona Creek were given the most points in this category.

Projects within 250 feet of Ballona Creek were given fewer points. Projects over 250 feet were given no points in this category.

4.2.3 EWMP Equivalent Volume Metric

The Ballona Creek EWMP identified the cumulative volume capture that must be achieved by stormwater projects within the City for a critical design storm demonstrating compliance with the City's MS4 permit. The volume captured during such a design storm, or EWMP Equivalent Volume, is modeled for each project using the Los Angeles County Watershed Reporting Adaptive Management and Planning System (WRAMPS). WRAMPS allows the user to enter basic project details (drainage area, storage capacity, imperviousness) to estimate capture volumes for a range of conditions, including critical conditions consistent with the Ballona Creek EWMP. Higher scores are given to projects that capture larger EWMP Equivalent Volumes. A comparison of the SWQMP modeled volumes to the EWMP goals is discussed in greater detail in Section 7.

4.3 Prioritization Scoring and Results

Each of the metrics outlined in Section 4.2 is organized into the prioritization scoring matrix presented in Table 4-1. Each project is evaluated across each metric (only the site suitability metrics applicable to the specific project type) and assigned a score between zero (0) and five (5) points. The matrix identifies the number of points (columns) assigned to specific ranges of parameter values for each metric (rows). The sum of the average of each score category is the final prioritization score (out of 15 total points).

Table 4-1. Prioritization Scoring Matrix

| Metric | Points | | | | | |
|---|----------------------------------|---------------------------|-------|------------|---------|----------------------------|
| | 0 | 1 | 2 | 3 | 4 | 5 |
| Site Suitability | | | | | | |
| Regional Stormwater Projects | | | | | | |
| Drainage Area (acres) | < 10 | 10-20 | 20-50 | 50-100 | 100-200 | > 200 |
| Site Slope (%) | > 10 | 5-10 | | 2-5 | | < 2 |
| Footprint Proximity to Storm Drain (ft) | > 500 | 200-500 | | 100-200 | | < 100 |
| Impervious Area (%) | < 40 | 40-50 | 50-60 | 60-70 | 70-80 | > 80 |
| Hydrologic Soil Group | D | | C | | B | A |
| Dry Wells | | | | | | |
| Drainage Area (acres) | < 1 | 1-2 | 2-5 | 5-10 | 10-15 | > 15 |
| Site Slope (%) | > 10 | 5-10 | | 2-5 | | < 2 |
| Impervious Area (%) | < 40 | 40-50 | 50-60 | 60-70 | 70-80 | > 80 |
| Within drainage area of another proposed project | Yes | | | | | No |
| Hydrologic Soil Group | D | | C | | B | A |
| Green Street Projects (Bioretention/Biofiltration) | | | | | | |
| Average Street Slope (%) | > 5 | 4-5 | 3-4 | 2-3 | 1-2 | 0-1 |
| Average ROW Width by Street Class ¹ | | Narrowest 33% | | Middle 33% | | Widest 33% |
| Utility Constraints ² | Multiple high conflict utilities | One high conflict utility | | | | No high conflict utilities |
| Within drainage area of another proposed project | Yes | | | | | No |
| Hydrologic Soil Group | D | | C | | B | A |

¹ Streets along wider rights-of-way (ROW) often contain more space to incorporate GI. Projects are sorted into the narrowest, middle, and widest third of streets by street class (e.g., local, connector, arterial).

² High conflict utilities that are prohibitively expensive to relocate include major gas transmission mains, trunk sewer lines, rail lines, and tunnels.

| Metric | Points | | | | | |
|---|--|---|-----------------------------|--|-----------------------------|---|
| | 0 | 1 | 2 | 3 | 4 | 5 |
| Multi-Benefits (All Projects) | | | | | | |
| In Neighborhood with Localized Flood Issues | No | | | | | Yes |
| Private Development Project Within Project Drainage Area | No | | | | | Yes |
| Pollutant Source Areas ³ (Contains at least 10%) | Other | Low-Density Residential | Transportation | High-Density Residential | Commercial | Industrial |
| Co-located With Another City Project ⁴ | No | | | | | Yes |
| Groundwater Constraints | In contamination area AND depth to groundwater < 10 ft | In contamination area OR depth to groundwater < 10 ft | | Depth to first groundwater 10 – 20 ft | | Depth to first groundwater > 20 ft |
| Disadvantaged Community (DAC) Benefit | Not a benefit to a DAC or Low-Income Community | | | Within the Sphere of Influence (500 ft) of DAC or Low-Income Community | | Within SB 535 DAC or AB 1550 Low Income Community |
| Urban Heat Island Index ⁵ | | UHII < 20% of Census Tracts | UHII > 20% of Census Tracts | UHII > 40% of Census Tracts | UHII > 60% of Census Tracts | UHII > 80% of Census Tracts |
| Ballona Revitalization | No | | | Within 250 ft of Ballona Creek | | Within 50 ft of Ballona Creek |
| EWMP Equivalent Volume | | | | | | |
| Equivalent Volume (AF) | 0-0.05 | 0.05-0.1 | 0.1-0.2 | 0.2-0.5 | 0.5-1.5 | > 1.5 |

Projects are bracketed into “High”, “Medium”, and “Low” priority categories based on percentiles. Projects in the 80th percentile of scores across all projects are assigned “High” priority. Projects in the 50th percentile of scores are assigned “Medium” priority. All remaining projects are assigned “Low” priority. Table 4-2 shows a summary of the projects within each priority category. Figure 4-5 through Figure 4-7 shows the geographic distribution of each project type across the City according to the priority category. The prioritization is included in Appendix E, and an Excel spreadsheet will be provided to the City that details each metric value and resulting score, the total score, priority category, and other site characteristics for each project. This spreadsheet serves as the database of prioritized projects identified by the SWQMP, but also as a tool to incorporate future

³ Based on mean storm event mean concentrations (EMCs) of total zinc (SCCWRP Technical Report 510, Figure 3-2)

⁴ Co-located projects may include those identified through various other City planning efforts: CIP, Safe Routes to School, Ballona Creek Revitalization Project, Bike & Pedestrian Action Plan, Urban Forest Master Plan, Economic Development Projects, or Planning Projects.

⁵ Urban Heat Island Index from CalEPA identify areas that experience the largest urban heat island effects and may benefit from additional greening.

identified projects into the database using the same prioritization framework. This process is explained in greater detail in Section 7.

Table 4-2. Summary of Priority Score by Project Type

| Bracket | Criteria | Project Type | | |
|--------------|---|--------------|------------|--------------|
| | | Regional | Dry Wells | Green Street |
| High | 80 th percentile | 10 | 26 | 48 |
| Medium | 50 th to 80 th percentile | 0 | 20 | 112 |
| Low | Below 50 th percentile | 0 | 88 | 137 |
| TOTAL | - | 10 | 134 | 297 |

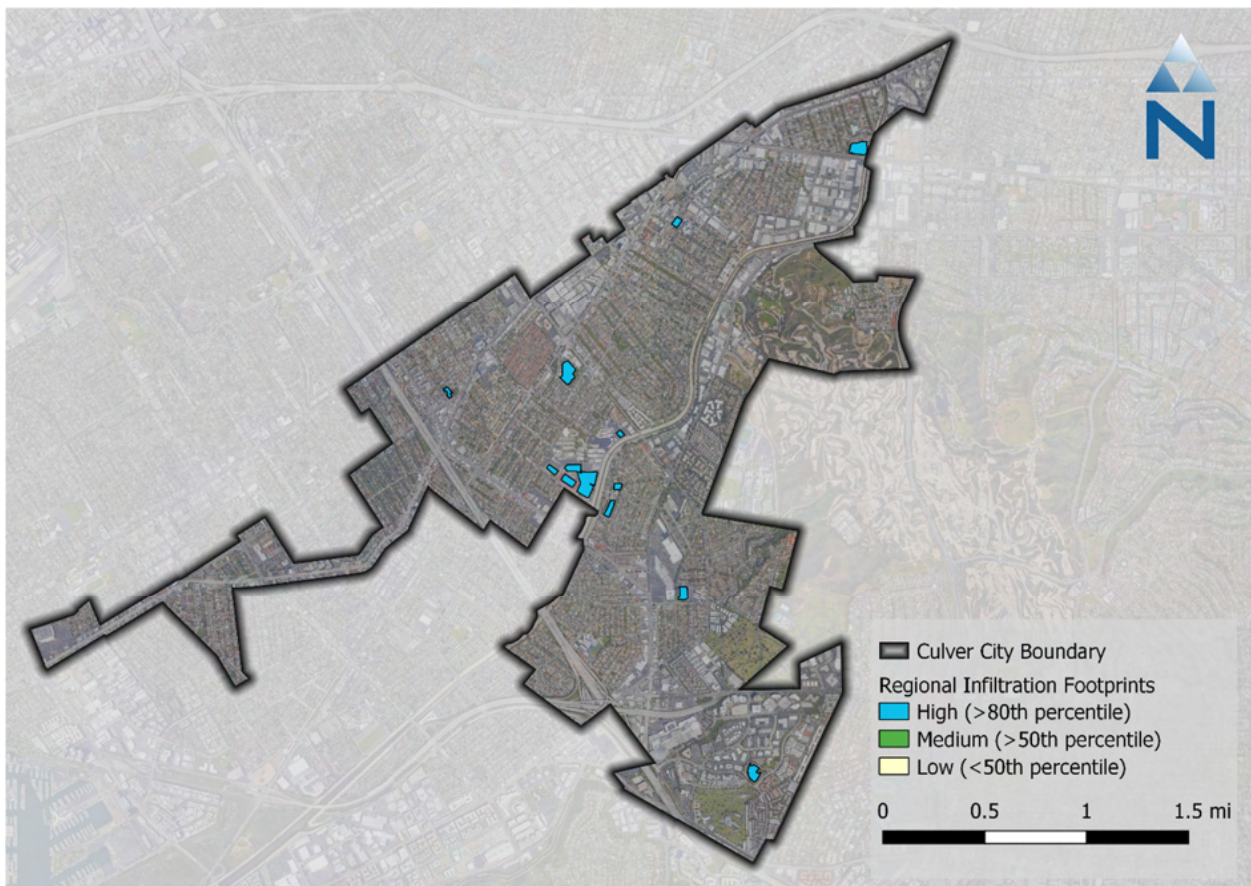

Figure 4-5. Regional project opportunities by priority score.

Figure 4-6. Dry well project opportunities by priority score.

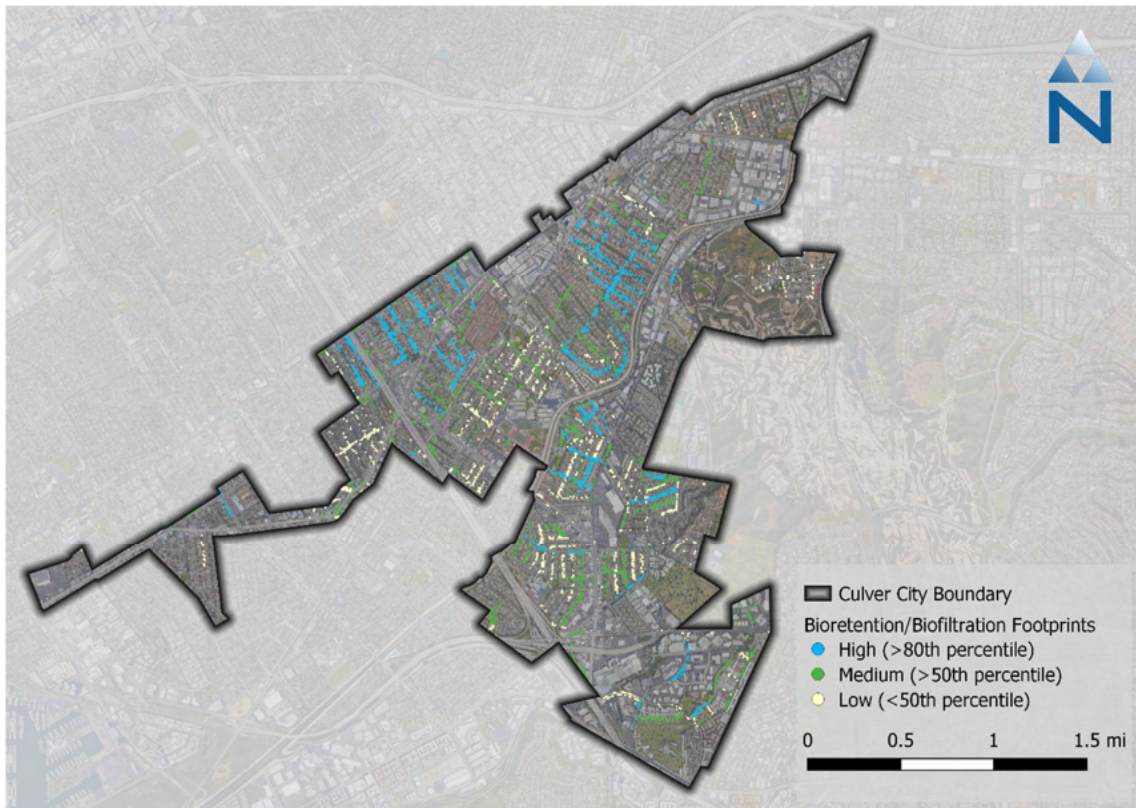

Figure 4-7. Green street project opportunities by priority score.

5 CONCEPT PLANS

The concept plan is a planning tool used to further evaluate site constraints, obtain input on design elements, and provide more detailed alternatives and cost estimates. The concept plan can also be used as a tool for communication with multiple audiences. The concept can be used to discuss specific design elements and communicate project benefits to City leaders, the public, and any additional stakeholders to obtain additional input or project support. Development of the concept involves collection of additional information including as-built plans, field investigation, coordination with the City and input from specific stakeholders and the community.

Each concept plan includes:

- Fact sheet with watershed and BMP design parameters and treatment capacity
- Project description including potential multiple benefits
- Figure showing preliminary BMP design concept footprint and location
- Cost estimate and cost per acre-foot treated
- If applicable, a preliminary Envision Sustainability Rating was provided

5.1 Concept Design Development

The priority projects generally use subsurface retention and infiltration as primary treatment. Based on the feasibility study and soil data, the priority projects were sited where infiltration may be feasible. Additional geotechnical and subsurface engineering feasibility analysis would be most valuable as a next step in the priority project locations.

To develop the concept designs, as-built plans were reviewed and evaluated to determine maximum depth of system to allow for gravity flow, or if pumps may be required. System depths and footprints were re-evaluated to treat the 85th percentile storm volume. The condition of the existing site, City Capital Improvement Plan and Parks Master Plan projects, as well as Ballona Creek Revitalization Planned projects and timelines were reviewed to look for opportunities to retrofit and/ or incorporate BMPs as part of a future project. Supplemental LID BMPs were incorporated where feasible.

6 STAKEHOLDER COORDINATION

6.1 Culver City Unified School District

Over 400 project opportunities were identified in this SWQMP analysis. As projects move forward to feasibility, stakeholder coordination will be required. Four of the top fifteen multi-benefit projects are located at or near Culver City Unified School District (CCUSD) schools, which accounts for over 30-percent of the total project capacity identified. The availability of open space and infrastructure, as well as potential for multi-benefits at school and park locations make these ideal stormwater quality project opportunities.

The development of this SWQMP occurred during a pandemic with limited coordination opportunities. However, coordination with CCUSD as a partner is anticipated as the City begins to work through which projects to implement.

7 IMPLEMENTATION PLAN

The Implementation Plan defines the process for implementing the prioritized regional, dry well, and green street projects identified in the SWQMP to meet water quality goals established by the EWMP. This includes steps necessary to move projects from the prioritized list through design and construction phases, as well as outlining steps to incorporate project opportunities identified in the future into the SWQMP and prioritization framework.

7.1 Project List Ranked by EWMP Equivalent Volume

While the SWQMP prioritized projects based on a variety of multiple benefits, the primary metric in terms of compliance with the MS4 permit is the EWMP Equivalent Volumes. All projects identified by the SWQMP were ranked and sorted by the largest EWMP Equivalent Volume – the projects that would achieve the most progress towards the water quality goals of the EWMP. This list serves as the starting point for the implementation of projects from the SWQMP and is not intended to dictate the exact order of project implementation. In practice, the order of implemented projects will largely be circumstantial – dependent on funding, scheduling, and stakeholder support. Instead, this list acts as a guide to identify the projects that would achieve the most progress towards water quality goals while serving multiple other benefits. Projects from the list can be proposed to advance to the next steps of implementation: feasibility assessments, concept development, design, and construction. Table 7-1 shows an excerpt from the list of projects ranked by EWMP Equivalent Volume. The full list can be viewed in an Excel spreadsheet provided to the City (CC_SWQMP_ProjectList_Scenarios_Final.xlsx).

Table 7-1. Project List Ranked by EWMP Equivalent Volume

| Rank | Site ID | Name | Type | Drainage Area (acres) | % Impervious | Storage Capacity (ac-ft) | EWMP Equiv. Vol (ac-ft) | Cost Estimate | Prioritization Score | Score Bracket |
|------|---------|----------------|----------|-----------------------|--------------|--------------------------|-------------------------|---------------|----------------------|---------------|
| 1 | R4 | High School | Regional | 131.67 | 69% | 7.932 | 2.39 | \$8,966,800 | 11.08 | High |
| 2 | R8 | Syd Kronenthal | Regional | 77.61 | 72% | 4.840 | 2.06 | \$5,471,500 | 12.9 | High |
| 3 | R10 | Veterans Park | Regional | 78.07 | 90% | 5.845 | 1.77 | \$6,607,900 | 11.23 | High |
| 4 | R2 | Farragut | Regional | 90.86 | 68% | 5.413 | 1.63 | \$6,119,100 | 9.28 | High |
| 5 | R9 | Tellefson | Regional | 72.33 | 89% | 5.365 | 1.62 | \$6,065,100 | 11.75 | High |
| 6 | R5 | Linberg North | Regional | 67.12 | 68% | 3.999 | 1.55 | \$4,520,700 | 10.7 | High |
| 7 | R1 | Blanco Park | Regional | 65.47 | 58% | 3.451 | 1.34 | \$3,901,400 | 9.75 | High |
| 8 | D28 | O_28 | Dry Well | 11.98 | 90% | 0.165 | 1.03 | \$550,000 | 10.85 | High |
| 9 | R3 | Fox Hills | Regional | 38.67 | 70% | 2.359 | 0.84 | \$2,666,600 | 9.08 | High |
| 10 | D31 | O_31 | Dry Well | 8.13 | 74% | 0.120 | 0.58 | \$400,000 | 9.58 | High |

7.2 Implementation Strategy

The SWQMP provides City staff with the tools necessary to evaluate and select identified projects for future implementation. The Workplan outlines the implementation strategy and steps for leveraging these tools to decide the projects that get implemented. The City's implementation strategy consists of five steps to advance projects identified in the SWQMP through construction depicted in Figure 7-1.

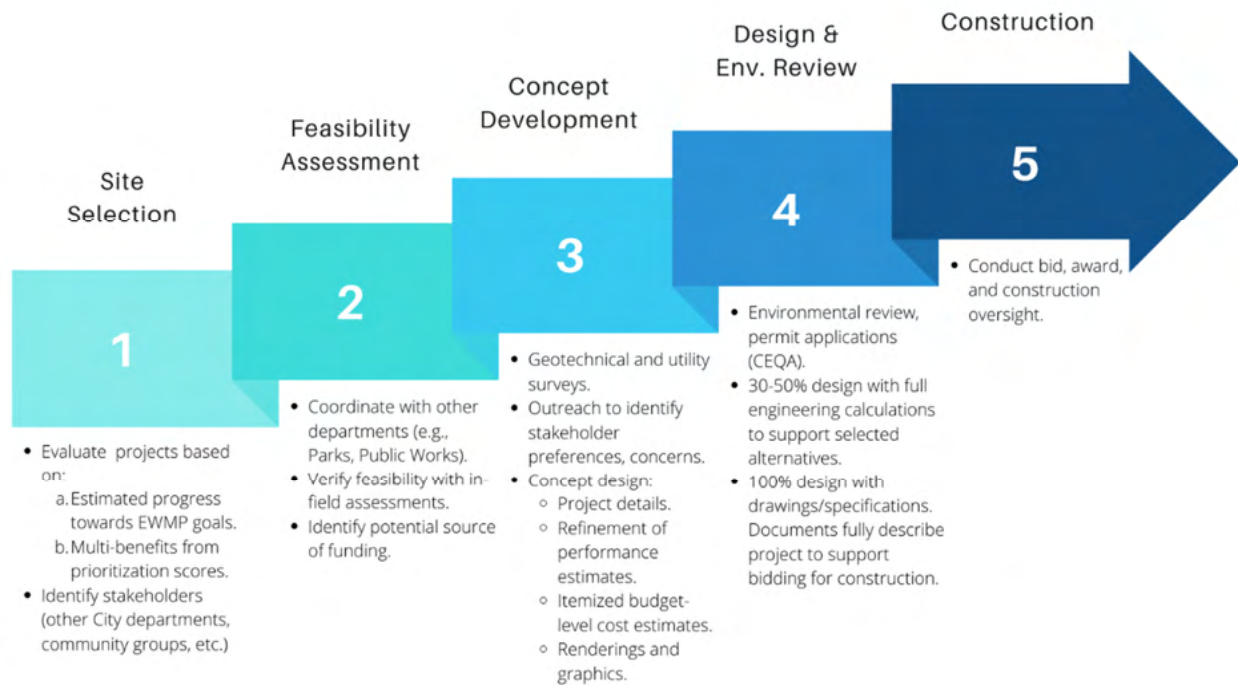

Figure 7-1. Overview of implementation strategy.

STEP 1: SITE SELECTION

The result of the project identification (outlined in the Master Plan document) and the prioritization process described in this Workplan is a list of projects that are evaluated for their ability to achieve progress towards water quality goals, an assessment of multiple benefits through the prioritization analysis, and preliminary planning-level cost estimates. The City will consider the estimated progress towards achieving the EWMP goals, a projects prioritization score, and identification of stakeholders. The list of projects ranked by estimated EWMP Equivalent Volume discussed in Section 4.2.3 serves as the starting point for identification of near-term projects that the City will select from and advance to the next steps of project implementation. The City will first identify a set of high-ranking projects from this list for consideration. From this set, scores from the prioritization analysis can be compared to identify the projects that achieve other multi-benefits in addition to water quality improvement. Projects that have both high EWMP Equivalent Volumes and prioritization scores are likely to perform well from a water quality perspective while exhibiting a higher number of benefits evaluated in the prioritization. Lastly, potential stakeholders should be identified for coordination during the feasibility assessment. For

example, a project on one of the City's public parks will require coordination with the City's Parks, Recreation, and Community Services department. Projects co-located with a planned street improvement will require coordination with the Public Works Department. Additionally, any relevant community groups should be identified for potential outreach during the concept development phase. During the prioritization, co-located capital improvement projects were identified for any of the SWQMP projects and are represented in the prioritization scoring. This can help determine which stakeholders may need to be involved. Once the City selects a priority project from the set of high-ranking projects under consideration, and the selection is approved by management, the project opportunity may advance to feasibility assessment.

STEP 2: FEASIBILITY ASSESSMENT

The feasibility assessment is intended to identify any potential constraints or challenges that could reduce the feasibility of the project (increased cost, engineering difficulty, or decreased performance) before too much effort is placed in concept development or stakeholder engagement. This should include 1) inter-departmental coordination, 2) a site assessment to verify constraints, and 3) an evaluation of potential funding sources. If any other City departments have been identified as potential stakeholders, those departments should be engaged early to assess support for partnership. If possible, a joint site walk should be scheduled with all departments to discuss expectations and priorities for the site. The site assessment should consist of a "desktop" survey of constraints using all available data, including locations of major utilities, grading issues, high groundwater levels, existing nearby groundwater contamination, etc. An in-field visit should be scheduled to verify results from the desktop survey, as well as to identify any additional constraints that may have been missed. Lastly, the potential funding mechanism should be identified. In addition to the County's Measure W and the City's Measure CW for stormwater projects, several opportunities for grant funding may be pursued and are discussed in Section 7.3. Once a project has met all feasibility criteria, a potential funding source has been identified, all stakeholders have been engaged, and management approval is obtained, the development of a concept design may be conducted. Any project that does not meet the criteria determined in the feasibility assessment can be removed from the list of projects, and a new priority site should be selected.

STEP 3: CONCEPT DEVELOPMENT

The concept design serves as a mechanism to further evaluate site constraints, obtain input on design elements, and produce more detailed alternatives and cost estimates. Additionally, the concept design serves as a tool for communication with multiple audiences. The concept can be used to discuss specific design elements, portray to the community what the potential project may look like, and communicate the project benefits to City leaders, the public, and any additional stakeholders. Development of the concept typically involves collection of additional information. This typically includes an in-depth utility survey, investigation of groundwater characteristics (e.g., depth to water table, infiltration rates, and assessment of existing contamination), and outreach to collect input from specific stakeholders and the community on specific design elements.

STEP 4: DESIGN AND ENVIRONMENTAL REVIEW

Once the concept design has been approved by relevant stakeholders and management, the City may issue a call for bids for the design and environmental review

of the proposed project. This step may include a pre-final (30 to 50 percent design) phase that includes full engineering calculations to support the selection of design alternatives. Final (100 percent) design includes the development of complete drawings and specifications and fully describe the project to support bidding (Design-Bid-Build) or construction (Design-Build). This step also includes the necessary environmental review of the project and obtainment of required permits.

STEP 5: CONSTRUCTION

The final step for project implementation is the construction. For the City, this consists of the bidding and awarding process, as well as providing construction oversight.

A diagram on the following page shows an overview of the process and considerations for Steps 1 through 3 (Figure 7-2)

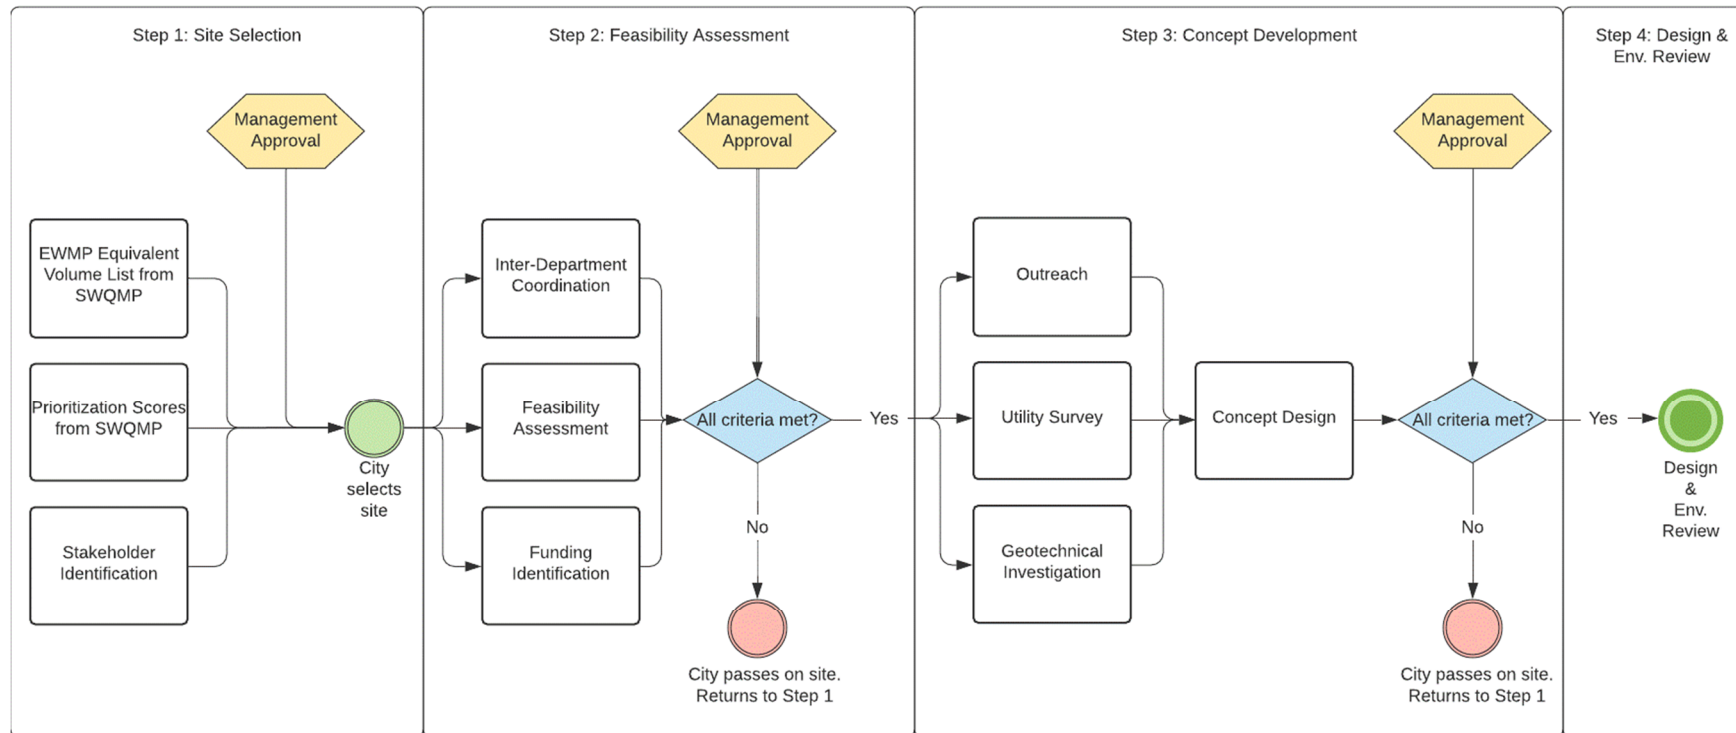

Figure 7-2. Process flow for Steps 1 through 4.

7.3 Grant Funding Strategy

To meet the requirements of stormwater regulations in the Los Angeles region, municipalities will need to invest heavily in infrastructure that improves stormwater quality. Municipalities that are members of the BC EWMP are estimated to need \$138 million for stormwater projects to meet full compliance. Historically, dedicated sources of funding for municipal stormwater programs and infrastructure have been difficult to secure. However, in 2016, Culver City and its residents took proactive steps to fund stormwater projects through passage of Measure CW, the Clean Water, Clean Beaches Parcel Tax dedicated to funding water quality programs that will reduce and prevent pollution of waterways, beaches, and the Ballona Creek Estuary. While Measure CW is estimated to generate around \$2 million annually, meeting compliance will likely require additional sources of funding. Grants will be key to bridging the gap in funding and ensuring the City obtains the resources needed to meet compliance and meet stormwater quality goals. This grant funding strategy outlines several local, state, and federal resources available to the City for the funding of stormwater quality projects.

7.3.1 Local Funding Programs

Measure CW created a dedicated source of funding for stormwater projects within the City. Additionally, Los Angeles County residents voted in 2018 to approve Measure W, a special parcel tax estimated to generate approximately \$300 million per year for clean water projects through the County's Safe Clean Water Program. Through this program, each of the County's municipalities receives a local share proportional to the amount of taxes collected within their jurisdiction. The combined revenue from Measure CW and the City's local share from Measure W is approximately \$2.75 million per year.

In addition to the local share provided by Measure W, 50 percent of Measure W funds will be allocated to the Regional Program, of which 85 percent will be used to directly fund the implementation of infrastructure projects. Through the [Regional Program](#), municipalities can submit planned projects through a competitive process that will be scored on effectiveness and other multiple benefits. Projects that score well in terms of water quality improvement, water supply benefits, nature-based solutions, benefits to disadvantaged communities, and community support may be approved for funding. To apply for funding through the Regional Infrastructure Program, submitted projects must include a feasibility study, or they can be submitted to the Technical Resources Program where feasibility study will be completed. The SWQMP provides the City with the first steps needed to complete a feasibility study and submit projects to the Regional Program, including:

- Identification of hundreds of stormwater projects and prioritization based on metrics relevant to the scoring criteria of the Regional Program. This effort provided a list of vetted project opportunities whose details may be further advanced through concept design for future submittal to the Regional Program.
- Development of concept designs for highest priority regional projects. Details, costs, and multi-benefits were determined during the concept design and will serve as the cornerstone for the feasibility study needed to submit these projects for consideration of Regional Program funding. The details developed for these concepts are also key input for the modeling of water quality and water supply benefits necessary for project scoring.

7.3.2 State and Federal Funding Programs

In addition to the local funding sources available from Measures CW and W, several funding programs are available from state and federal agencies. Some of these programs focus on stormwater while other sources of funding may focus on other priorities, like climate change, sustainability, resiliency, and active transportation. The City can leverage these grant funding opportunities through the pursuit of creative well-rounded and multi-benefit stormwater projects that are attractive to several programs. This approach opens multiple avenues to fund the City's stormwater projects and increases the chances that the City can leverage outside funding. For example, bioretention implemented along roadways that also incorporate transportation improvements can appeal to both urban greening and active transportation advocates while also improving stormwater quality. Several of the prioritization metrics used in the SWQMP were chosen to fit different applications relevant to alternative funding opportunities.

A key grant opportunity is through the state's Stormwater Grants Program (Proposition 1). This program focuses on projects that capture and treat stormwater or dry weather runoff while providing a variety of potential benefits, including water supply, flood control, habitat enhancement/restoration, or creation of green spaces. Eligible projects specifically include green infrastructure, rainwater and stormwater capture, and stormwater treatment facilities and are directly relevant to the types of projects proposed by the SWQMP. More information can be found at waterboards.ca.gov.

Another key opportunity for funding is from California Climate Investments, an initiative that uses California's cap-and-trade dollars to invest in projects related to affordable housing, renewable energy, public transportation, zero-emission vehicles, environmental restoration, and clean technologies that reduce pollution. A variety of programs, ranging from urban greening and urban forestry to climate resiliency and sustainable communities, are available to local municipalities. A list of these programs can be found at caclimateinvestments.ca.gov.

The Active Transportation Program (ATP), administered by Caltrans and the California Transportation Commission, can be a potential funding source for stormwater projects along City streets. The ATP focuses on projects that increase the proportion of trips accomplished by biking and walking, increase safety and mobility for non-motorized users, promote greenhouse gas reduction, and enhance public health while ensuring disadvantaged communities have equal access to the benefits of the program. Green street elements can incorporate traffic safety features like curb extensions and bulb-outs at crosswalks that increase pedestrian visibility/safety and encourage non-motorized transport. More information on applying for program funds can be found at catc.ca.gov.

The grant programs discussed above are just a few key programs available to municipalities. There are many other state and federal grant programs that can be explored, and where possible, the City will explore multi-benefit stormwater projects that may be able to leverage these alternate sources of funding. Some of these programs are listed below.

State Programs:

- Affordable Housing and Sustainable Communities (AHSC)
- Cal Department of Forestry and Fire Protection: Urban and Community Program
- Cal Clean Water State Revolving Fund
- Cal Department of Water Resources: Integrated Regional Water Management Program Implementation Grants
- Cal Natural Resource Agency Urban Greening Grants
- Cal Drought, Water, Parks Climate Protection, and Outdoor Access For All Act of 2018
- Cal State Parks Land & Water Conservation Fund and Rails-to-Trails Programs
- Caltrans Cooperative Implementation Agreements or Grants Program
- Safe Routes to Schools
- Strategic Growth Council: Urban Greening Program
- Transportation Development Act, Article 3 (TDA 3)
- Transportation Fund for Clean Air (TCFA)
- Transportation for Livable Communities (TLC)

Federal Programs:

- FEMA Hazard Mitigation Grant Program
- FEMA: Pre-Disaster Mitigation Grant Program
- USDA: US Forest Service Urban and Community Forestry Program
- USDOT: Transportation Investment Generative Economic Recovery (TIGER) Program
- USDOT: Federal Highway Administration (FHWA) Surfaces Transportation Block Grant – Transportation Alternatives Set-Aside
- US HUD: Community Development Block Grant (CDGB)
- US HUD: Sustainable Communities Regional Planning Grants
- US HUD: Community Challenge Planning Grants
- US EPA: Clean Water State Revolving Fund
- US EPA: Urban Waters Small Grants Program

The City will continuously engage state and federal agencies that administer these programs to best understand expectations for grant proposals. Through this engagement, the City will be able to identify which programs are likely to pair well with stormwater projects and obtain a more thorough understanding of the selection criteria. As part of its funding strategy, the City will diligently track the timing of various grant proposal solicitations to identify when proposal efforts can be leveraged for multiple grants and to increase opportunities for funding from multiple sources.

7.3.3 Public-Private Partnerships

Public-private partnerships can be an effective strategy for implementing stormwater projects. Such partnerships are contractual agreements between a public entity and private landowners and developers to provide some asset or service that provides a public benefit. For stormwater quality projects, this often takes the form of a private landowner allowing the construction of a stormwater facility on their property and funding a portion of the project in exchange for the public entity bearing the burden of design, construction, and maintenance.

Culver City has successfully entered a public-private partnership with the Culver City Costco to construct the [Washington Boulevard Stormwater and Urban Runoff Diversion Project](#) to meet MS4 permit requirements. Through the partnership, Costco funded \$2.14 million of the \$8 million project cost that would have otherwise been spent to meet its own stormwater permit requirements. The City is also able to build a more effective project with 30 percent cost savings than if the two entities had pursued separate projects. Through the agreement, Costco also pays an annual fee for the City to assume full responsibility for ongoing maintenance. The project will capture and store dry and wet weather runoff until it is slowly released to the sanitary sewer system where it will be treated for pollutants by the City of Los Angeles' Hyperion Reclamation Plant. The project will reduce the transport of pollutants to the Marina del Rey Harbor.

Public-private partnerships create positive working relationships between the City and its local businesses, while creating opportunities to implement more effective, lower cost projects that clean local water resources. The City will continue to search for opportunities for public-private partnerships as part of its funding strategy.

7.4 Adaptive Management

The SWQMP is designed to serve the City as a "living" document that will continue to be updated over time to incorporate multiple benefit projects as they are identified. The dashboard and Excel project database contain comprehensive lists of priority-ranked locations for project opportunities on City-owned parcels and public rights-of-way. This database of potential project locations will serve as a resource for the selection of stormwater capture projects throughout time to meet the water quality goals of the EWMP. Once those projects are more fully conceptualized, the SWQMP will be used as the primary mechanism for ensuring that other multiple benefits are incorporated into project concepts and designs. The SWQMP may be updated due to the identification of new project opportunities that may offset the need for additional projects required to meet the EWMP goals. The dashboard tools outlined in the previous sections were developed to provide the City with the flexibility needed to update project details and prioritization scores (see Figure 7-3). Additionally, new projects may be added to the database and scored using the same criteria by entering a few project details.

| Metric | Points | | | | | |
|--|--|--|----------------|--|------------|------------------------------------|
| | 0 | 1 | 2 | 3 | 4 | 5 |
| REGIONAL STORMWATER PROJECTS | | | | | | |
| Drainage Area (acres) | Less than 10 | 10 to 20 | 20 to 50 | 50 to 100 | 100 to 200 | 200 or greater |
| Drainage Area Slope (%) | 10 or greater | 10 to 5 | | 5 to 2 | | Less than 2 |
| Proximity to Storm Drain (ft) | Greater than 500 | 500 to 200 | | 200 to 100 | | Less than 100 |
| Impervious Area (%) | Less than 40 | 40 to 50 | 50 to 60 | 60 to 70 | 70 to 80 | 80 to 100 |
| Hydrologic Soil Group | D | | C | | B | A |
| DRY WELL PROJECTS | | | | | | |
| Drainage Area (acres) | Less than 1 | 1 to 2 | 2 to 5 | 5 to 10 | 10 to 15 | 15 or greater |
| Drainage Area Slope (%) | 10 or greater | 10 to 5 | | 5 to 2 | | Less than 2 |
| Impervious Area (%) | Less than 40 | 40 to 50 | 50 to 60 | 60 to 70 | 70 to 80 | 80 to 100 |
| Hydrologic Soil Group | D | | C | | B | A |
| GREEN STREET PROJECTS | | | | | | |
| Slope (%) | Greater than 5 | 5 to 4 | 4 to 3 | 3 to 2 | 2 to 1 | 1 or less |
| ROW Width by Street Class | | Narrower 35' | | Mode 35' | | Wider 35' |
| Utility Constraints | Multiple high conflict utilities | One high conflict utility | | | | No high conflict utilities |
| Within Drainage Area of Another Proposed Project | Yes | | | | | No |
| Hydrologic Soil Group | D | | C | | B | A |
| MULTI-BENEFITS (All Projects) | | | | | | |
| In Neighborhood with Localized Flood Issues | No | | | | | Yes |
| Private Development Project Within Drainage Area | No | | | | | Yes |
| Pollutant Source Areas Drainage area contains at least 10% | Other | Low Density Residential | Transportation | High Density Residential | Commercial | Industrial |
| Co-located With Another City Project | No | | | | | Yes |
| Opportunity to Augment Water Supply | No | | | | | Above groundwater recharge site |
| Groundwater Constraints | In contamination area AND depth to groundwater < 10 ft | In contamination area CPI depth to groundwater < 10 ft | | Depth to first groundwater 10 - 20 ft | | Depth to first groundwater > 20 ft |
| Disadvantaged Community (DAC) Benefit | Not a benefit to a DAC or Low Income Community | | | Within Sphere of Influence of DAC or Low Income Community 100 ft | | Within Low Income Neighborhood |

| Percentile Cutoff | Score Bracket |

| 80% | High |
| 50% | Medium |
| 0% | Low |

Read Me

Criteria tabs:
This tab outlines the scoring rubric utilized in the prioritization process of the Culver City Stormwater Quality Master Plan.

Each row represents an individual metric evaluated for each project. If the metric for a project falls within one of the ranges specified across the row, it receives the number of points corresponding to the column header. For example, a regional project with a drainage area of 150 acres will receive 4 points for that metric. The sum of scores for all rows comprises the total project score. Scores for each project type are presented in the subsequent tabs.

The spreadsheet is designed to provide as much flexibility as possible to modify the metric values in the future. Orange text may be updated to change the score ranges. By default, this sheet is password protected to prevent unintentional modification of the formulas. If cell formulas must be updated, the user may click on **Review > Unprotect Sheet** and enter the following password for editing capabilities:

culvercityswqmp2020

Regional, Dry Wells, & Bioretention tabs:
These tabs allow the user to enter project details within the "Site Information" and "Raw GIS Calculations" column groups. Details for the projects currently included in these tables may be modified and the associated scores will automatically update according to the scoring

Figure 7-3. Screenshot of the Prioritization Matrix containing editable cells for modifying scoring criteria, updating project details, and entering new projects in the future.

The WRAMPS website (wramps.org) may be used to retrieve estimates of EWMP Equivalent Volume for newly identified projects. This allows for direct comparison of stormwater capture effectiveness to projects already within the SWQMP database. WRAMPS allows users to enter project details for planned or build projects to estimate stormwater capture consistent with the methodologies used in the EWMPs (see Figure 7-4).

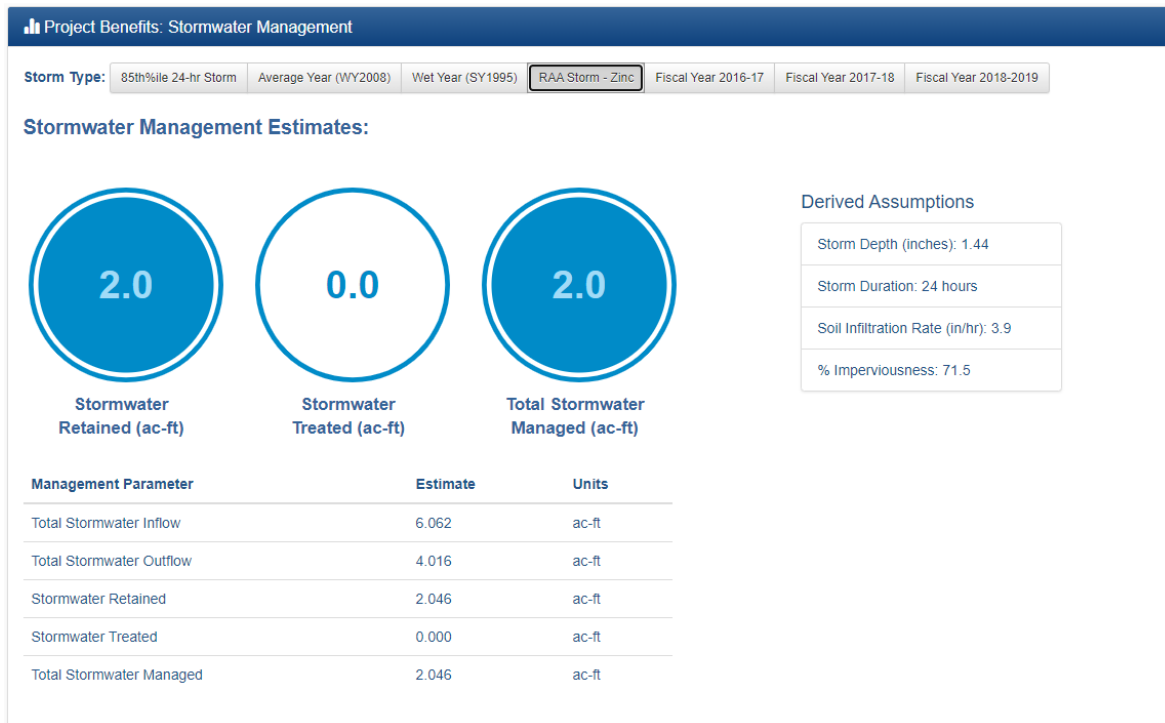

Figure 7-4. Screenshot of the estimated stormwater capture benefits from WRAMPS for an example Culver City project.

8 PUBLIC OUTREACH PLAN (POP)

The City of Culver City (City) is developing a Stormwater Quality Master Plan (SWQMP) to guide proposed actions for compliance with the municipal separate storm sewer system (MS4) permit, Ballona Creek Enhanced Watershed Management Program, Marina Del Rey Enhanced Watershed Management Program, and ultimately to achieve the total maximum daily load (TMDL) requirements that drive these regulations. The SWQMP addresses only projects within the Ballona Creek watershed and is intended to be used as a tool for the City to achieve stormwater quality goals efficiently, identify and prioritize project opportunities, maximize funding opportunities, and engage with the community, stakeholders, and potential project partners.

The City is required to meet stormwater quality compliance targets outlined in the Ballona Creek Enhanced Watershed Management Program. To do that, the City is responsible for capturing 99 acre-feet of stormwater. The analysis included in the SWQMP resulted in identification of over 400 of the best project opportunities that, if constructed, would achieve 69 acre-feet of capture. While still short of the 99 acre-feet goal, the estimated cumulative cost of these 400 projects would take over 25 years to construct with the current budget of \$2.7M per year. The SWQMP is a decision-making tool to help the City establish a defensible stormwater quality compliance strategy that provides three different ways to prioritize projects: 1) by Annual Budget; 2) by Cost-Effectiveness; and 3) by Multi-Benefit Metrics. Depending on the priorities of the City, different projects can be selected to move forward into feasibility study, design, and construction. The SWQMP also includes a web-based dashboard tool to facilitate collaboration within the City to increase efficiency, and track compliance progress as well as spending through the planning, bid, and construction phases of a project. Lastly, this SWQMP includes concept plans for the top ranked Multi-Benefit priority projects intended to be used as a communication tool to obtain project funding and public engagement once pushed forward to the feasibility study stage.

The Public Outreach Plan establishes a comprehensive outreach program for engaging stakeholders in the SWQMP development process. This Public Outreach Plan outlines the approach and methods by which the project team will engage stakeholders and set the stage for implementation of project opportunities identified in the SWQMP.

8.1 Engagement Objectives

The following objectives define the purpose of outreach and engagement during development of the SWQMP.

- Raise awareness and inform stakeholders about:
 - The need for and purpose of the SWQMP and project opportunities identified in the SWQMP
 - Cost to achieve stormwater quality goals and funding sources
 - Opportunities for public participation and input
- Report on the project team's work to date in developing the SWQMP
- Clearly communicate how project opportunities were identified, and prioritization methods

- Clearly communicate how the SWQMP tool can be used for planning, budgeting, and meeting stormwater quality compliance targets
- Respond to stakeholder questions and concerns
- Seek information and feedback on elements of the SWQMP, and incorporate input as appropriate to finalize the SWQMP
- Garner public acceptance of the SWQMP and project opportunities contained within the SWQMP
- Facilitate adoption of SWQMP by City Council

8.2 Key Stakeholders and Level of Involvement

There are a range of stakeholders and interested parties in Culver City and region-wide, from decision-making bodies to utilities, environmental organizations, and residents. Using the following tool as a foundation for identifying stakeholders and their appropriate level of involvement, the Spectrum of Public Participation (see figure below) developed by the International Association for Public Participation (IAP2) clarifies the role of the public in planning and decision-making. The Spectrum identifies five levels of public engagement: Inform, Consult, Involve, Collaborate, and Empower. The farther to the right on the Spectrum that a decision maker chooses, the more impact or influence the public expects to have on the decision. Individual stakeholder groups can be at different levels on the Spectrum and can migrate amongst levels at different phases of the process. Each level on the Spectrum includes a public participation goal and the underlying promise to the public.

IAP2 Spectrum of Public Participation

IAP2's Spectrum of Public Participation was designed to assist with the selection of the level of participation that defines the public's role in any public participation process. The Spectrum is used internationally, and it is found in public participation plans around the world.

| INCREASING IMPACT ON THE DECISION | | | | | |
|-----------------------------------|--|--|---|---|--|
| | INFORM | CONSULT | INVOLVE | COLLABORATE | EMPOWER |
| PUBLIC PARTICIPATION GOAL | To provide the public with balanced and objective information to assist them in understanding the problem, alternatives, opportunities and/or solutions. | To obtain public feedback on analysis, alternatives and/or decisions. | To work directly with the public throughout the process to ensure that public concerns and aspirations are consistently understood and considered. | To partner with the public in each aspect of the decision including the development of alternatives and the identification of the preferred solution. | To place final decision making in the hands of the public. |
| PROMISE TO THE PUBLIC | We will keep you informed. | We will keep you informed, listen to and acknowledge concerns and aspirations, and provide feedback on how public input influenced the decision. | We will work with you to ensure that your concerns and aspirations are directly reflected in the alternatives developed and provide feedback on how public input influenced the decision. | We will look to you for advice and innovation in formulating solutions and incorporate your advice and recommendations into the decisions to the maximum extent possible. | We will implement what you decide. |

© IAP2 International Federation 2018. All rights reserved. 20181112_v1

This plan assumes that during SWQMP development most stakeholders and the general public will be at the Inform or Consult level of the Spectrum. However, when advancing projects forward to design and construction, stakeholders such as residents and businesses near the proposed project location and project partners, could be at the Involve or Collaborate level of the Spectrum.

Target audiences for public outreach and involvement efforts for this process include, but are not limited to:

- Utilities
- School district
- Residents
- Businesses
- Developers
- Park users/leagues
- Neighborhood and homeowners associations
- Community organizations
- Environmental groups
- City government
- Regional Board
- Tribal groups
- Local media outlets (although not technically a stakeholder, the media is a primary audience group that can help disseminate information to the greater local public)

8.3 Engagement Tactics

Engagement requires a multi-pronged approach to reach different community members and key stakeholder groups, as outlined in the table below. As a result of the COVID-19 pandemic, the engagement strategy has been designed to accommodate mandatory social distancing guidelines while ensuring effective, equitable, and safe engagement for the development, and ultimately adoption, of the SWQMP.

The following are tactics that will be implemented to achieve the engagement objectives stated earlier in this plan.

| Tactic | Expected Timing | Description |
|----------------|---------------------------------------|---|
| Webpage | Develop in May 2021; Update as Needed | Establish a webpage to serve as an online repository for information and resources, such as the fact sheet, workshop materials, opportunities to participate and provide input, information on how to contact the project team, and a sign-up form to receive future updates. Webpage will be hosted on the City's website. |

| | | |
|---------------------------------------|---|---|
| | | |
| Project Email and Phone Number | May 2021 through City Council Adoption anticipated in August 2021 | Maintain a project phone number and email through which stakeholders can communicate questions and comments to the project team. |
| Stakeholder List | May 2021 through City Council Adoption anticipated in August 2021 | Establish and maintain a list of key stakeholders. This list should be updated on an ongoing basis by adding stakeholders who attend briefings and public workshop(s), contact the project team, and sign up on the webpage to receive future updates. |
| Key Messages & FAQs | May 2021 | Develop a messaging plan and use it as the basis for all communications. Develop a frequently asked questions (FAQs) document to respond to anticipated questions. FAQs can be posted on the webpage. |
| Fact Sheet | May 2021 | Develop a fact sheet for use on the webpage, during stakeholder briefings, and at the virtual public workshop(s). Use visuals and graphics to help communicate complex information when possible. Fact sheet will be translated into Spanish. |
| Notifications | As Needed Based on Milestones | <p>Updates and event notifications will be provided to stakeholders via multiple channels, including:</p> <ul style="list-style-type: none"> • E-blasts via GovDelivery • News releases targeting local media, such as Culver City News and Culver City Observer, and regional media • Social media channels (including Facebook, Twitter, Instagram, and Nextdoor) • Multicultural and neighborhood networking – electronic notice and request for key stakeholders to distribute via newsletters, email lists, websites, and social media |

| | | |
|-----------------------------|-------------|---|
| Public Workshop(s) | June 2021 | Hold up to two public workshops to educate stakeholders and solicit feedback on elements of the SWQMP. Project team members will provide an informative presentation and answer questions during the workshop(s). Hold workshop(s) via a virtual platform such as Zoom that also allows participation by phone and incorporate interactive components as appropriate unless and until in-person meetings are allowed and practical. Develop a brief logistics memo to include details, such as format, agenda, and necessary staffing and materials. The logistics memo will also include an outline for publicizing the workshop(s), including methods and schedule. |
| City Council Meeting | August 2021 | The City Council will consider adoption of the SWQMP at a regularly scheduled City Council meeting. Members of the public will have the opportunity to provide comments before the City Council takes action. |

8.4 Engagement Schedule

The following shows the schedule of key engagement milestones.

| | May | June | July | August |
|--------------------------------|-----|------|------|--------|
| Webpage | | | | |
| Project Email and Phone Number | | | | |
| Stakeholder List | | | | |
| Key Messages & FAQs | | | | |
| Fact Sheet | | | | |
| Draft SWQMP Released | | | | |
| Notifications | | | | |
| Stakeholder Briefings | | | | |
| Public Workshop(s) | | | | |
| Final SWQMP Released | | | | |
| City Council Meeting | | | | |

8.5 Equitable Engagement

Seeking feedback from a broad and diverse group of stakeholders is a key objective of this plan. The following are considerations and strategies to ensure equitable engagement within Culver City and the region.

8.5.1 Varied Engagement Types

COVID-19 safety concerns and precautions have shifted communication and engagement to primarily virtual platforms while Stay at Home orders and/or mandatory social distancing guidelines are in place, and engagement may continue to be largely via online formats even after orders are lifted. Although online platforms provide easy access for many, digital resources pose challenges for those without access to the Internet and other disadvantaged communities. As such, the following strategies will be implemented:

- Offer information through varied channels, including a project phone number and hard copies where possible. Materials will be made available in hard copy to stakeholders by request.
- Adhere to ADA standards for digital resources, including but not limited to sizing, formatting, and inclusion of descriptions and captions for images and videos.

8.5.2 Engaging Multicultural Communities

The following are potential strategies to ensure engagement with multicultural communities within Culver City and the region:

- Include in the stakeholder list relevant multicultural organizations, including tribal contacts, Spanish-speaking organizations, advocacy groups, and other multicultural contacts; leverage connections with them to notify their communities and seek input from them.
- Provide key materials in English and Spanish.
- Provide Spanish or other language meeting options upon request.
- Designate a Spanish-speaking project team member to handle Spanish inquiries received through communication channels.

8.6 Evaluation

At various points in the engagement process, particularly after a key milestone or event, the project team will assess how well the communication and engagement methods that were implemented met the objectives outlined in this plan. This evaluation will allow the project team to update strategies or redirect resources as needed to ensure a successful outcome for public outreach.

Metrics to evaluate the effectiveness of the engagement include:

- Feedback received from key stakeholders
- Level of preparedness of spokespersons
- Identification of anticipated questions and responses to these questions
- Level of community participation in opportunities for input and attendance at events
 - Number of and types of comments received
 - Number and variety of commenters
- Number of community events and notification/outreach activities
- Quantity and quality of balanced media coverage
- Webpage view metrics gathered and tracked

Questions to consider for evaluation of the outreach process may include:

- Were engagement objectives met?

- Were stakeholders properly identified?
 - If not, which stakeholders were missing?
- Were stakeholders properly reached?
 - Were any communication methods not successful in reaching the intended audience?
 - If not, is there another communication method that may work better?
- Did attendees leave events feeling their concerns and questions were addressed?
- Was information presented in an understandable way?
- Did the workshop format meet the needs of the community and allow for successful interaction?
- Did attendees understand how to make an informed, substantive comment that would be helpful in the development of the SWQMP?
- Were stakeholders generally satisfied with the outreach process?

To answer these types of questions, the project team will obtain informal feedback from stakeholders to evaluate the outreach process.

8.7 Summary

Implementation of this Public Outreach Plan is the City's best effort to ensure stakeholders and the public are engaged in the SWQMP development process to obtain meaningful feedback on the SWQMP. Public information and outreach materials and stakeholder/public comments and responses are included in Appendix F.

9 SWQMP PROJECT SUMMARY

9.1 Comparison to BC EWMP Water Quality Goals

The Ballona Creek EWMP has served as the guiding document for the implementation of stormwater projects in the City since its approval by the RWQCB in 2016. The EWMP and RAA modeling were completed using the best state-of-science and modeling practices at the time of publication to demonstrate that implementation of the BMP strategy developed by the RAA would result in compliance with the MS4 Permit. The RAA modeling was based upon project opportunity screening on a watershed-scale across all jurisdictions in the Ballona Creek watershed using a generalized approach. The SWQMP opportunity identification goes into greater detail by looking exclusively at Culver City-owned properties with City-specific datasets and known constraints to refine potential project opportunities. Feasibility was considered in greater depth for the identification of the projects in the SWQMP. As a result, the SWQMP projects vary from the BMP strategy identified in the EWMP but contain projects that have a higher chance of being implemented. The EWMP contains provisions for adaptive management; as long as the EWMP compliance targets are met, municipalities may implement a different set of projects as conditions change and additional feasibility data is collected. As such, it is expected that implemented projects will vary from the original EWMP list. Table 9-1 shows the EWMP compliance targets and the combination of stormwater BMPs needed to meet that target identified by the RAA.

The EWMP compliance targets are based on critical metals (zinc) and bacteria storms. These storms were developed based on an analysis that determined treatment of these storm sizes would result in meeting receiving water limitations (RWLs) for zinc and an allowable number of exceedance days annually for bacteria. This analysis is documented in greater detail in the EWMP (BCWMP 2016). For Culver City, this means that approximately 118.3 acre-feet of runoff must be managed by stormwater BMPs during a 24-hour storm. This volume can be achieved through any combination of stormwater BMPs, although Table 9-1 represents the most cost-optimal solution from the RAA. Table 9-1 also compares the SWQMP project capacities to the capacities identified by the RAA.

Table 9-1. EWMP Compliance Targets Comparison

| EWMP Compliance Targets | | RAA Storage Capacity (ac-ft) | | | | |
|---------------------------------------|---------------------------------------|------------------------------|---------------|---------------|----------------|-------------|
| Metals 24-hour Volume Managed (ac-ft) | Bacteria 24-hr Volume Managed (ac-ft) | LID | Green Streets | Regional BMPs | Regional (TBD) | Total |
| 108.5 | 118.3 | 17.6 | 19.6 | 5.3 | 56.5 | 98.7 |
| <i>Percent Total Capacity =</i> | | <i>18%</i> | <i>20%</i> | <i>5%</i> | <i>57%</i> | <i>100%</i> |
| SWQMP Project Capacity = | | 9.6 | 19.6 | 40.0 | 29.5 | 98.7 |
| <i>Percent Total Capacity =</i> | | <i>10%</i> | <i>20%</i> | <i>41%</i> | <i>30%</i> | <i>100%</i> |

The 24-hour volume managed was modeled for each project using WRAMPS. The cumulative volume managed of all identified SWQMP projects estimated in WRAMPS is approximately 37 ac-ft of the required 118.3 ac-ft (roughly 37% of the required reduction). While per-project estimates allowed for the relative comparison of stormwater capture performance across projects in the prioritization analysis, the sum of these estimates may

not adequately represent the citywide impact of all SWQMP projects. To compare to the EWMP goals based on volume managed, the SWQMP projects would need to be modeled in an update to the RAA to understand the holistic impacts the distributed SWQMP projects would have on the City's compliance progress. While an RAA was not a part of the SWQMP development, the projects identified in the SWQMP can be used to inform planned updates to the Ballona Creek EWMP and RAA in 2021.

Without an update to the RAA, the most reliable indicator of progress is the total project capacity. The SWQMP identified 441 projects with a total capacity of 69.2 acft of the required 98.7 acft (roughly 70% of the required capacity). This does present a marked improvement over the distribution prescribed in the EWMP. Following EWMP development, the City was expected to provide 56.5 acft of BMP capacity from unidentified regional projects assumed to be on private property. The proposed distribution in the SWQMP closes that gap to 29.5 acft.

9.2 Closing the Compliance Gap

The compliance gap is the difference in the volume required to meet water quality goals and the volume of identified projects. The BC EWMP recognized this gap to be filled by regional private projects. Moving forward, the City can consider the following:

- As the BC EWMP is updated, the RAA will also be reconsidered. Rather than rely on the low-resolution approach provided across the watershed, Culver City can have the RAA update team include the SWQMP proposed project distribution. Using more refined information may alter the total volume the City is expected to provide capacity for, further closing the gap.
- The SWQMP approach is to provide the City with a compliance planning progress tracking tool and web viewer. The SWQMP did not include projects that have already been constructed on private property, such as industrial permit compliance projects or privately installed post-construction BMPs to satisfy MS4 permit requirements. The City can add these projects to the database to increase project volume.
- As private development occurs in the City, partnership opportunities may exist to increase project volume.
- The capacities of projects identified as part of this study were estimated based on desktop analysis. Priority project concepts were developed further based on a closer look at site conditions and the project capacities were re-estimated. However, as feasibility analyses are completed for planned projects, actual project capacities may change, or there may be opportunities to oversize the facilities to increase a project's capacity. Examples where capacity increases might occur would include:
 - If more favorable soil characteristics are found at a project location than what was assumed in this analysis, the project may be able to infiltrate more water in 24 hours.
 - If a sewer analysis is completed as part of the feasibility analysis, and capacity exists for diversion to the Hyperion Reclamation Plant, the project may be built to capture more volume than originally assumed.
 - If a project adds dry wells that increase infiltrated volume.
 - If more space is available than originally assumed and project capacity is increased

Appendix D – Concept Plans & Fact Sheets

PROJECT WATERSHED

DESIGN CRITERIA

| | |
|---|------|
| Precipitation, 85 th percentile, 24-hr storm (in) | 1.1 |
| Runoff Volume, 85 th percentile, 24-hr storm (ac-ft) | 4.6 |
| Peak Discharge, 85 th Percentile, 24-hr storm (cfs) | 18.0 |
| Assumed Design Infiltration Rate (in/hr) | 0.25 |

SITE DESCRIPTION

Syd Kronenthal Park is a unique opportunity for a stormwater quality improvement project - ideally situated at the northern boundary of Culver City with City of Los Angeles and along the Ballona Creek. Project scope and multi-benefit impact of a successful project in this important location depends on a feasibility analysis. The proposed stormwater capture project ("Project") described in the following application includes runoff diversion from existing storm drains and Ballona Creek/Adams Channel into large-scale underground storage chambers combined with a shallow reservoir for passive irrigation for the park. Project feasibility could unlock other potential project components that include Adams Channel Nature walk, dry or wet weather flow diversions, and associated extensions of existing bike paths further into the City of Los Angeles to broaden the access to the Ballona Creek Bike Path which continues for eight miles to the Ballona Creek Wetlands and Pacific Ocean.

The most cost-effective project variation would include infiltration of the underground storage. However, further study may determine infiltration to be infeasible. Given the ideal location next to the Ballona Creek and just downstream of the Adams Channel tributary, as well as available real estate, the project would still be a valuable water quality asset for water storage during wet weather for diversion to sanitary sewer, year round irrigation, treatment and discharge, or a combination of all the above.

A preliminary analysis to identify this project included review of available soils information; and the project is located within a potential liquefaction zone area. Additional site-specific geotechnical study is required to determine infiltration feasibility at between 10 and 20 feet below ground surface, as well as groundwater and seismic constraints. Results of the geotechnical study would define the most appropriate type and scope of capture project. Once the type of capture project is defined, technical resources to develop scope and complete the nineteen Feasibility Study requirements.

Although not included in this project concept, the Syd Kronenthal Park facility is considered a "Critical Facility" in the City Hazard Mitigation Plan and includes a community building and Parks and Recreation offices, a daycare, and multipurpose rooms that could present an opportunity for direct reuse inside the buildings.

WATERSHED CHARACTERISTICS

| | |
|---------------------|------------------------------------|
| Watershed Area (ac) | 77.5 |
| Imperviousness (%) | 69 |
| Dominant Land Use | Residential – Low Density SF / ROW |

CONCEPT DESIGN EXAMPLES

COST ESTIMATE FOR SYD KRONENTHAL PARK PROJECT

| DESCRIPTION | QUANTITY | UNIT | UNIT COST | TOTAL |
|--|----------|------|-------------|---------------------|
| Excavation Removal | 21,907 | CY | \$50 | \$ |
| Diversion Structure 0-10 cfs | 2 | LS | \$30,000 | \$60,000.00 |
| Pre-Treatment 5-10 cfs | 2 | LS | \$20,000 | \$40,000.00 |
| SD Pipe (24" RCP) | 1,000 | LF | \$200 | \$200,000.00 |
| Field Permavoid | 85,930 | SF | \$20 | \$1,718,600 |
| Parking Lot Permavoid | 22,798 | SF | \$20 | \$455,960 |
| Parking Lot Grasscrete | 23,000 | SF | \$15 | \$345,000 |
| Infiltration Structure, >10ft Cover(0-5 acft) | 259,970 | CF | \$12.50 | \$3,249,625 |
| Restoration (park) | 94,5631 | SF | \$3 | \$283,593 |
| Adams Channel Nature Walk | 1 | LS | \$TBD | \$-- |
| Adams Channel or Ballona Creek Pump Station | 1 | LS | \$1,500,000 | \$1,500,000 |
| CONSTRUCTION TOTAL | | | | \$8,948,128 |
| Mobilization (25% construction) | | | | \$2,237,032 |
| Contingency (25% construction) | | | | \$2,237,032 |
| Design (10%) | | | | \$894,813 |
| TOTAL COST | | | | \$14,317,005 |
| COST PER VOLUME MITIGATED (\$/ACFT) | | | | \$1,477,077 |

CONCEPT SCHEMATIC

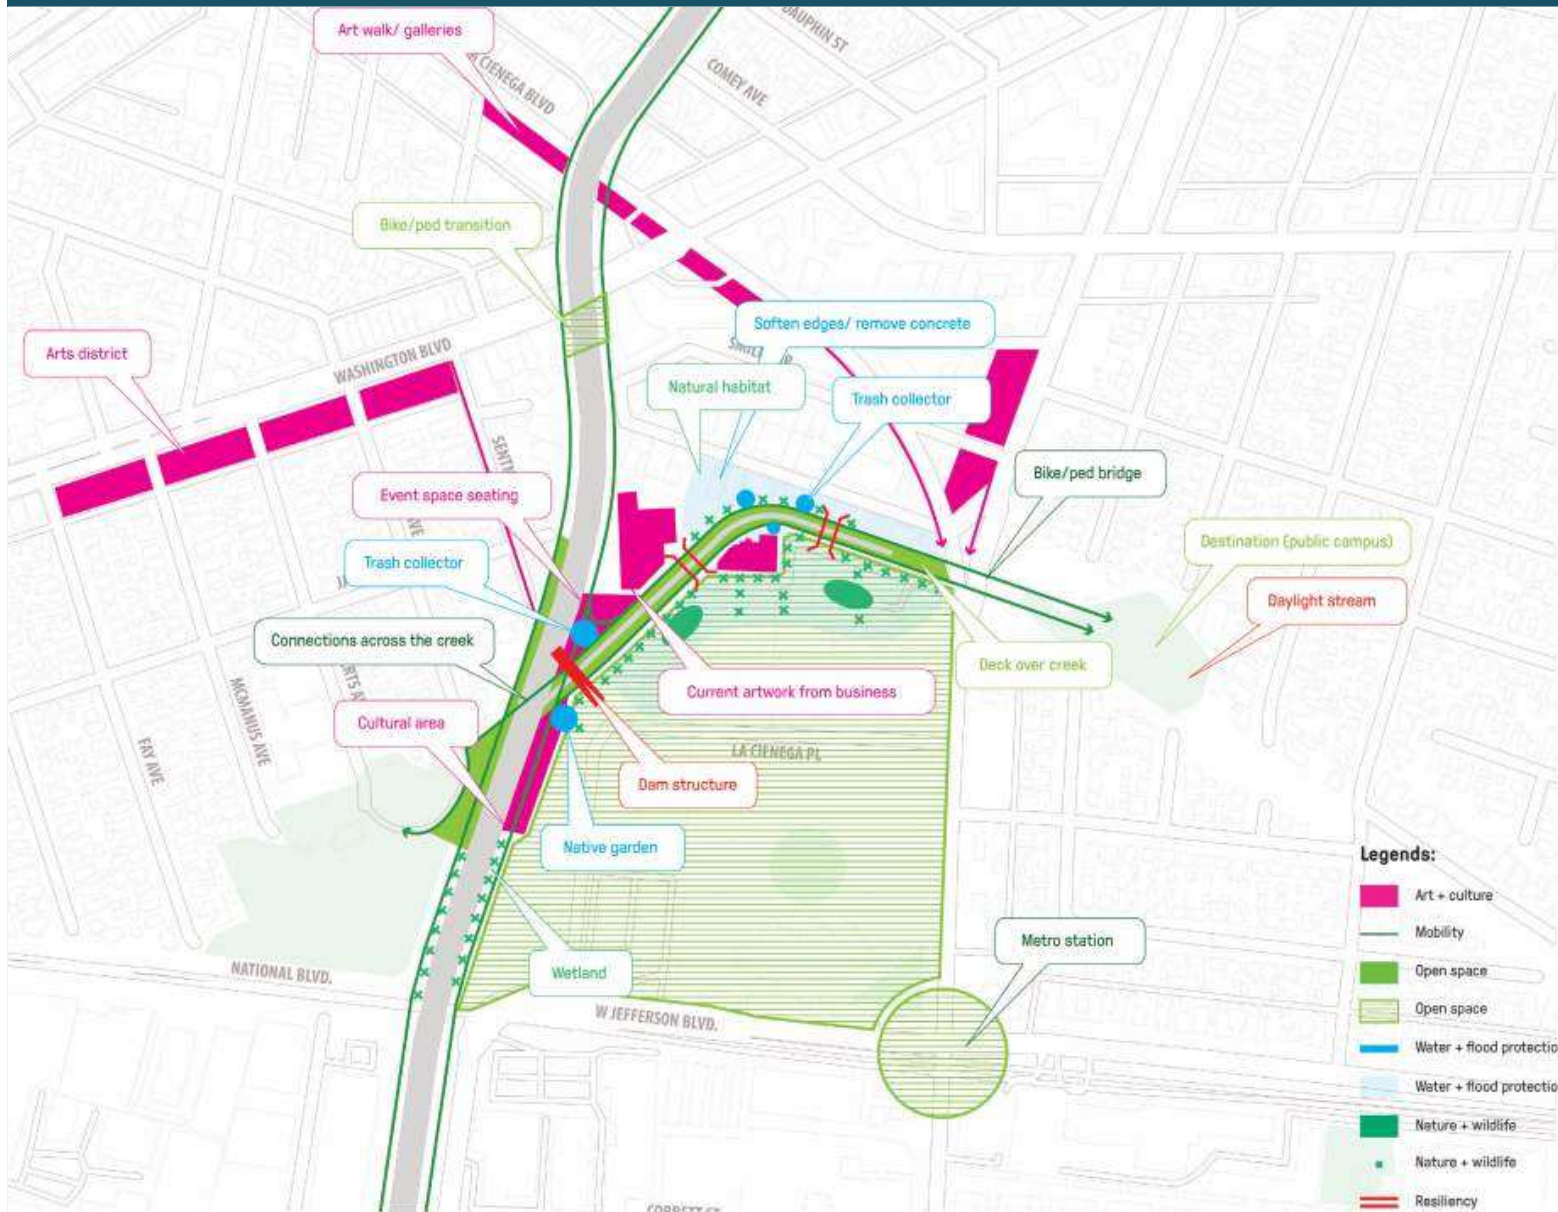

PROJECT CHARACTERISTICS

| | |
|--|------------------------------|
| Stormwater BMP | Harvest & Use / Infiltration |
| Footprint (acres) | 1.7 |
| Max Design Height (ft) | 6.5 |
| Depth of Excavation (ft) | 18 |
| Depth to Groundwater (ft) | 28 |
| Pump Requirements | TBD |
| Design Storage Volume + 24 hr Infiltration (ac-ft) | 7.6 |
| Estimated Water Use / Capture Volume (ac-ft) | 3.0 / 2.1 |
| Total 24-hr Wet Weather Treatment Volume (ac-ft) | 9.7 |
| EWMP Equivalent Volume (ac-ft) | 1.8 |

*Disclaimer: All elements of this conceptual design are planning-level, based on desktop analysis. All assumptions are parameters must be re-evaluated during the detailed design process. Cost estimates are based on available data. Actual costs will vary.

OFFSITE CONCEPTS – ADAMS CHANNEL NATURE WALK

PRELIMINARY SCORE

KEY SUSTAINABILITY HIGHLIGHTS

QL: Holistic assessment and collaboration to address changing social, economic, and/or environmental conditions. Enhancement of community health and safety by providing critical infrastructure to reduce risks. Creation of new community connections and active transportation facilities.

LD: Strong commitment to sustainability, community involvement, collaboration and partnerships with stakeholders.

RA: Net-positive improvement to watershed resources.

NW: Regional stormwater management, surface and ground water quality improvements, ecosystem enhancement, floodplain restoration.

CR: Climate threats shared with community, integrated risk evaluation with owner and diverse team of key stakeholders.

OPPORTUNITIES TO INCREASE SUSTAINABILITY

QL: Reduce noise, vibration, and light pollution impacts during construction and operation. Empower communities to engage in development process and address injustices or imbalances.

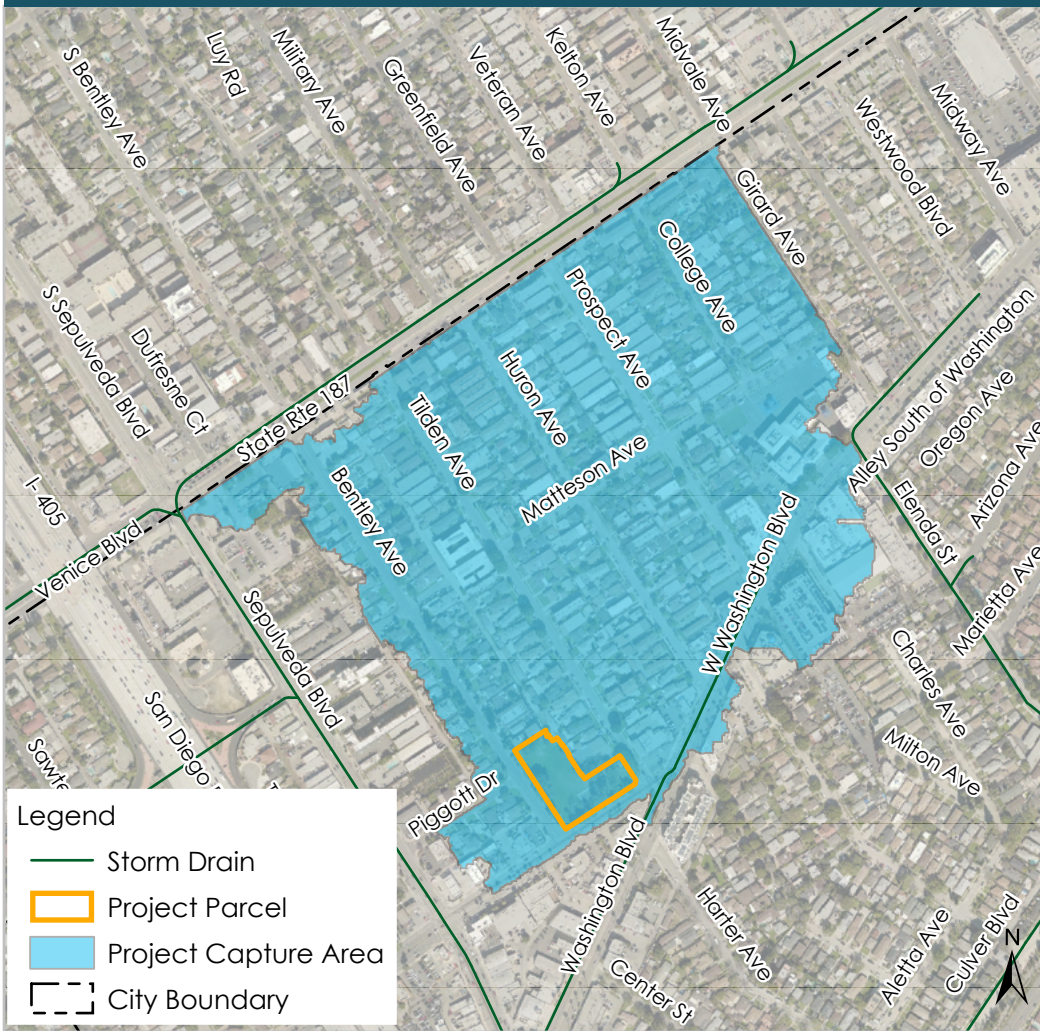

LD: Plan for end of life, develop local skills and capabilities, conduct a life cycle economic evaluation.

RA: Reduce waste, energy and water usage, increase renewable energy, balance earthwork or source/reuse within 25 miles of the site.

CR: Address air pollutant emissions, Incorporate resilience strategies into operation and maintenance of project, measure and quantify benefits of implementing resilience strategies.

SITE DESCRIPTION

Tellefson Park is located at the western edge of Culver City. Tellefson Park is one of the parks listed on Culver City's Five Year Capital Improvement Plan.

Evaluation of the playground area and picnic area indicated both are in good or very good conditions. The on site restrooms are in excellent condition, having been constructed in 2003. BMPs for this location have been identified as either a short term/ immediate project or a long term/ replacement and repair project.

Potential short term Capital Improvements include replacing the existing outdated playground with new play equipment. Although the playground area has been noted as in good condition, there are plans to remove the rubberized resilient surfacing and incorporate ramps for ADA accessibility. The BMP paired with this project would include installing an underground infiltration chamber.

A long term/ replacement and repair project is to renovate the turf field. BMPs to include at that time consist of infiltration chambers underneath the field with the potential to mitigate 61 percent of the water quality runoff volume from the 72 acre watershed. Runoff would be diverted from existing storm drain, and pre-treated before being conveyed into a large infiltrating chamber. A new catch basin and storm drain system may be needed to capture runoff currently sheet flowing along Bentley Avenue. BMP options also include installing a shallow reservoir to maximize natural infiltration and nature-based passive capillary irrigation and has the potential to replace 48 percent of the potable water demand from the field.

Reuse of harvested water for toilet flushing is not considered as the restrooms are still in excellent condition.

Should geotechnical conditions and groundwater depths be verified, dry wells could be added to this project to increase the volume of water mitigated. Should geotechnical investigation find infiltration to be infeasible, stored water could be pumped to sanitary sewer for reuse.

Culver City Stormwater Quality Master Plan Priority Concept Project: R9 Tellefson Park

Source: City of Culver City

PROJECT WATERSHED

SITE DESCRIPTION

Veterans Park is located at the western edge of Culver City, and is one of the parks included in the City's Five Year Capital Improvement Plan (CIP) as well as in the Parks & Recreation Facility Conditions Assessment Report.

The concept plan includes an underground storage for infiltration under the park near Barman Avenue, as well as the opportunity to capture and reuse stormwater for park irrigation. The BMP footprint covers approximately 75 percent of the park area and would have potential capacity to capture 100% of the 85th percentile storm event runoff volume. The watershed is 78-acres and 90 percent impervious.

Stormwater would be diverted from an existing 48-inch-diameter storm drain in Overland Avenue. Gravity flow could convey the water through pretreatment and into the storage chambers. Stored water would ideally be infiltrated, pending geotechnical study and constraints. A shallow reservoir could be pump-filled from the deeper storage to be used as passive irrigation for the field grass above. Approximately 80% of the potable irrigation demand from the fields could be replaced.

Should site specific geotechnical investigation show infiltration is infeasible, stormwater capture for delayed release to sanitary sewer would be an alternative option for this site due to proximity to sewer. Maximizing capacity at this location could also provide opportunities for credit trading and increased overall progress toward Ballona Creek EWMP compliance targets, as the majority of this watershed falls within the City of Los Angeles.

PROJECT WATERSHED

PROJECT SITE INFORMATION

| | |
|----------------------|-------------------------------------|
| Land Owner | Culver City Unified School District |
| Street Address | 4401 Elenda St. |
| Latitude / Longitude | 34 0012.01N - 118 24 03.2W |

WATERSHED CHARACTERISTICS

| | |
|------------------------|---|
| Watershed Area (acres) | 131.67 |
| Impervious Area (%) | 69 |
| Dominant Land Use | Residential - Low Density Single Family |

SITE DESCRIPTION

Culver City High School is located at the south boundary of Culver City with City of Los Angeles, along the west edge of Ballona Creek. This project presents opportunities to combine MS4 Phase II water quality requirements for school districts with multi-benefit water quality projects.

The concept plan was developed as a modular design for flexible implementation to best fit Culver City Unified School District (CCUSD) and City goals and budgets. The project includes large scale infiltration chambers underneath athletic fields with the potential to capture more than 100% of the water quality runoff volume from the 132 acre watershed. Runoff would be diverted from existing storm drains in two locations, pumped, and pre-treated before being conveyed into large infiltrating chambers, potentially in series. BMP options also include field turf replacement with a shallow reservoir to maximize natural infiltration and nature-based passive capillary irrigation or pavement replacement. These shallow reservoirs help reduce heat island effect by regulating field and pavement temperatures while providing water supply benefits.

Although not included in this project concept, school buildings could be an opportunity for interior re-use, since rainfall typically occurs during fall and winter months when schools are in session. Another alternative could capture of stormwater for delayed release to sanitary sewer based on proximity to existing sanitary sewer lines. Additionally, because this Project has the potential to capture more than 100% of the water quality volume, it could be a candidate for credit trading once a program becomes available.

BMP1: Underground storage and infiltration gallery with irrigation reuse opportunity. Water is diverted from existing 78-inch storm drain in Harter Avenue and pre-treated. Overflow could be conveyed to BMPs 2, 3, and/or 4.

BMP2: Underground storage and infiltration gallery with irrigation reuse opportunity.

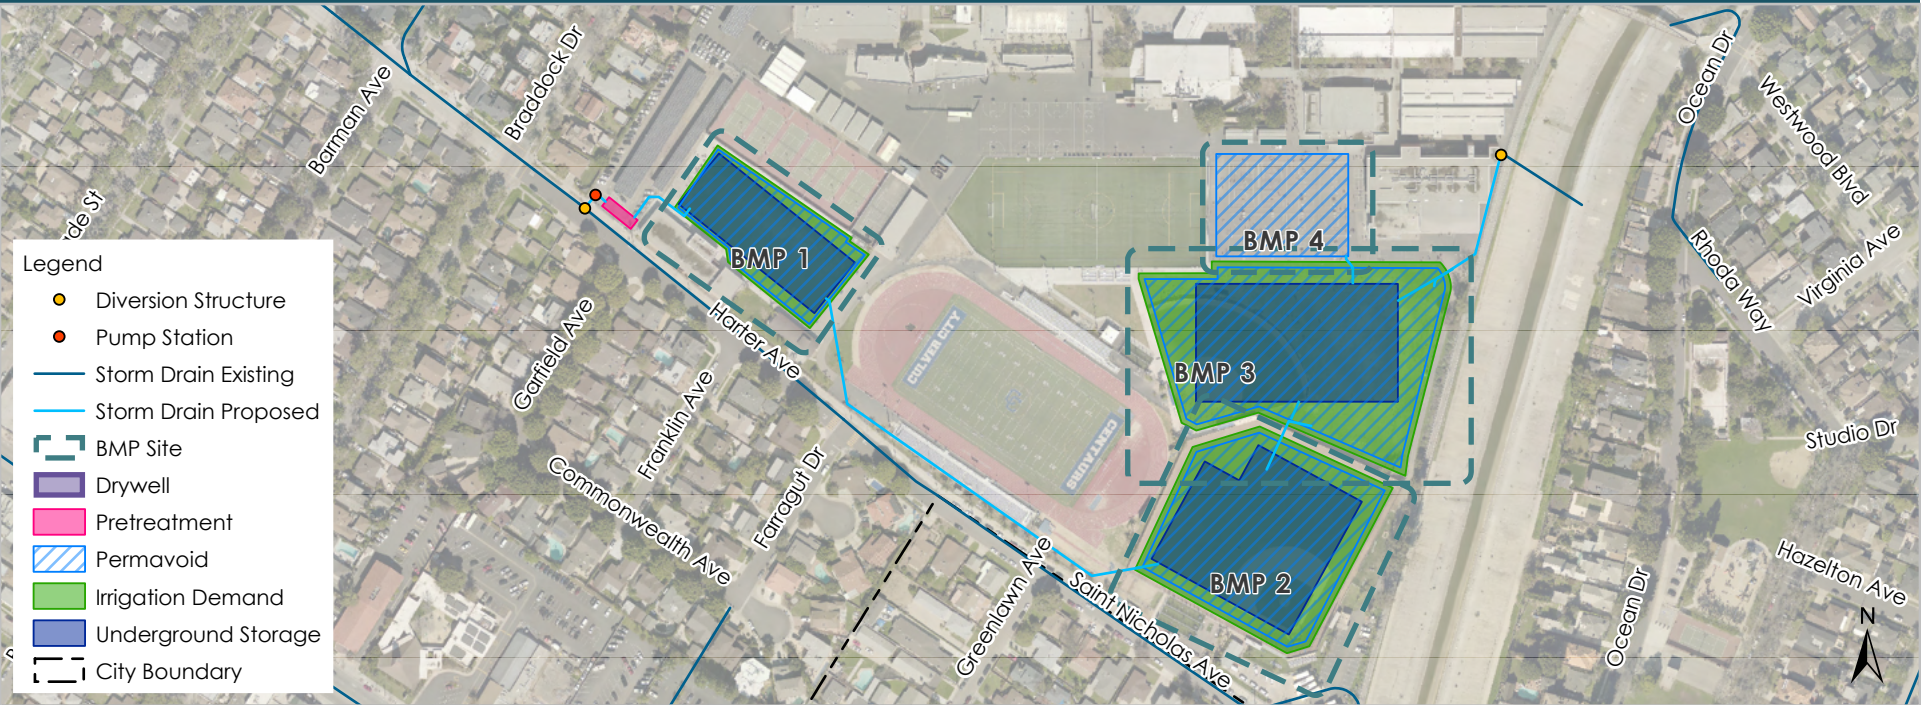

BMP3: Underground storage and infiltration gallery with irrigation reuse opportunity. Diversion of existing direct connection to Ballona Creek storm drain back to project BMPs.

BMP4: Shallow underground infiltration to add infiltration surface could be coupled with a pavement replacement project with pervious pavement.

PROJECT WATERSHED

SITE DESCRIPTION

This concept plan was developed for multiple dry wells located on Washington Blvd between Overland Ave and Westwood Blvd. The dry wells will have the potential to capture and infiltrate a majority of the water quality runoff volume from the 18.55 acre watershed. Runoff will continue to follow its existing drainage condition and sheet flow to the curb and gutter. The dry wells will be equipped with a diversion structure to allow excess runoff to bypass the system.

Drywells will be installed adjacent to the three existing catch basins at the intersection of Washington Blvd and Westwood Blvd. In addition, three dry wells will be installed along Washington Blvd within the drainage area.

Six dry wells are proposed as an estimated representation of average conditions, however, the actual number may be adjusted pending site specific geotechnical analysis.

| Latitude / Longitude | 34 00 07.09N - 118 23 55.7W |

SITE DESCRIPTION

Lindberg Park is located at the southern edge of Culver City near the eastern bank of Ballona Creek. It is one of the parks with planned improvements included in the City's Capital Improvement Plan (CIP), as well as in the Parks & Recreation Facility Conditions Assessment Report.

This concept plan was developed with the timeline of CIP improvements in mind; BMPs for this location have been identified as long-term replacement and repair projects.

The drainage area of Lindberg Park is approximately 75 acres and 67 percent impervious. BMPs would include two underground infiltration galleries. BMP1 would be located on the south side of Lindberg Park near Cota Street and BMP2 would be located on the north side of the park near Kingston Avenue. The BMPs together would have capacity to capture more than 100 percent of the 85th percentile storm volume.

A pump structure would divert water from the existing 75-inch-diameter storm drain in Cota Street. Water would be conveyed through pretreatment and into BMP1 at the south side of the park. Overflows from BMP1 could be conveyed to BMP2 at the north side of the park. A new catch basin and storm drain pipe may be required to capture surface runoff in Cota Street.

Harvested water could also be used for reuse as irrigation in the park, with potential to supply approximately 80% of the potable irrigation demand. Reuse of harvested water for toilet flushing was not considered as part of this concept plan, as restrooms are still in good condition.

PROJECT SITE INFORMATION

| | |
|----------------------|-----------------------------|
| Land Owner | Culver City |
| Street Address | 5801 Sawtelle Blvd. |
| Latitude / Longitude | 33 59 45.35N - 118 23 33.0W |

SITE DESCRIPTION

Blanco Park is located on Sawtelle Blvd at Overland Drive just east of El Rincon Elementary school. The park area includes a picnic area, soft ball diamond, and an open turf area. The park is located near the upstream end of a storm drain system that drains into Centinela Creek, a tributary of Ballona Creek. The storm drain system is anecdotally over capacity and flooding is often observed in Overland Drive. The location of the park would be ideal to divert 95 acres of open space/residential land use which would otherwise contribute to local flooding.

This Concept Project includes large scale infiltration chambers underneath the park with the potential to more than 100% of the water quality volume. Runoff would be diverted from an existing 48" storm drain in Overland Drive and pre-treated before gravity draining into the infiltration structure. Using a shallow reservoir to maximize natural infiltration and nature-based passive capillary irrigation under the turf could replace up to 30% of the estimated water use of the field. These shallow reservoirs help reduce heat island effect by regulating field temperatures while providing water supply benefits. Removing the water quality volume from the MS4 and Ballona Creek would improve flood conveyance in the systems.

PROJECT WATERSHED

SITE DESCRIPTION

This concept plan was developed for a residential greenstreet project located along Madison Ave between Culver Blvd and Ballona Creek.

This project will consist of biofiltration and retention in the parkways with accommodation of existing mature trees and utilities. Including harvest and use.

The greenstreet improvements has the potential to mitigate up to 109 percent of the water quality runoff volume from the 21.35 acre watershed. Including harvest and use Permavoid reservoirs can help augment water supply by keeping water available for the existing vegetation and trees and replace 73 percent of the potable water demand. All work proposed in this area would have to be reviewed by an arborist and the Urban Forester to ensure that the health of the existing street trees is maintained.

Two dry wells will be installed adjacent to the existing inlet located upstream of Ballona Creek. The actual number and location will depend on site-specific geotechnical conditions.

Culver City Stormwater Quality Master Plan
Priority Concept Project: BR91 Madison Ave Greenstreet

PROJECT WATERSHED

SITE DESCRIPTION

Farragut Elementary School is located near the center of the City along the Ballona Creek. This project presents opportunities to combine MS4 Phase II water quality requirements for school districts with multi-benefit water quality projects.

The concept plan was developed as a modular design for flexible implementation to best fit Culver City Unified School District (CCUSD) and City goals and budgets. The project includes infiltration chambers underneath the field with the potential to mitigate 43 percent of the water quality runoff volume from the 91-acre watershed. Runoff would be diverted from existing storm drain and pre-treated before being conveyed into underground infiltrating storage. BMP options include a shallow reservoir under the sports fields to maximize natural infiltration and reuse for nature-based passive irrigation and has the potential to replace 46 percent of the potable water demand from the field. Opportunities for converting impervious areas to pervious pavements with additional underground infiltration storage could be considered when pavement replacement projects are planned.

Should geotechnical conditions and groundwater depths be verified, dry wells could be added to this project to increase the volume of water mitigated. Although not included in this project concept, school buildings could be an opportunity for interior re-use, since rainfall typically occurs during fall and winter months when schools are in session. A small garden is located on site that could also benefit from the harvested stormwater. Another alternative could capture of stormwater for delayed release to sanitary sewer based on proximity to existing sanitary sewer lines.

PROJECT WATERSHED

SITE DESCRIPTION

Originally identified as a greenstreet opportunity, this location is better suited for dry wells based on visual inspection, high traffic volume, and because this street is critical for City emergency operations. Dry wells are ideal for locations with deeper groundwater, where open space is limited, or where other constraints exist to limit construction duration.

This concept plan was developed for multiple dry wells located on Duquesne Ave between Culver Blvd and Ballona Creek. The dry wells will have the potential to capture and infiltrate the water quality runoff volume from the 19.27 acre watershed. Runoff will continue to flow in its existing drainage condition to sheet flow to the curb and gutter. The dry wells will be equipped with a diversion structure to allow excess runoff to bypass the system.

Street flow in Duquesne Ave are intended to be captured by dry wells placed at five of the existing catch basins. Two additional dry wells will be installed along Duquesne Ave. The existing catch basin located at the north corner of Duquesne Ave and Lucerne Ave accepts flows from both streets. Two dry wells will be installed on opposite sides of that catch basin. The catch basins located on the other cross streets are not currently considered as part of this project.

The locations of the nine dry wells are proposed as an estimated representation of average conditions. The actual number and location will depend on site-specific geotechnical conditions.

PROJECT WATERSHED

GALVIN STREET TREES

SITE DESCRIPTION

The greenstreet project on Northgate is an option in response to the City's request to incorporate stormwater quality solutions into an effort to maintain two healthy ficus trees on Galvin Street. Currently, these two trees are healthy but impacting pavements in the right of way. Based on consultation with the city Urban Forester, the root zone on these two trees are extensive - saturation of the soils and/or subsurface root disturbance is not advised. Instead, an increased the air/gas exchange area is proposed in the form of an extended curb and elimination of the sidewalk on the east edge of Galvin Street. Runoff from the street and an existing gutter behind the lots could flow through this extended planter in a rain garden-type landscape, but would not be encouraged to pond and infiltrate. Filtered water should continue to flow out towards Northgate Street. All work proposed in the area would have to be reviewed by an arborist. This project alone would not be designed to capture stormwater runoff.

To address stormwater capture, a residential greenstreet project may be installed downstream of the ficus trees. The project would consist of biofiltration and retention in the parkways with accommodation of existing mature street trees. Including harvest and use Permavoid reservoirs would augment water supply by keeping water available to the landscape plants and street trees for a longer period of time. All work proposed in this area would also have to be reviewed by an arborist and the Urban Forester to ensure that the health of existing street trees is maintained.

Due to the retrofit nature of the project, biofiltration cell areas may be limited and will not be able to accommodate 85th percentile runoff from the tributary watershed. Depending on site-specific geotechnical conditions, additional capture could be achieved by constructing dry wells at the downstream end of the Northgate Street.

Culver City Stormwater Quality Master Plan Priority Concept Project: BR168 Northgate St & Galvin Street

PROJECT WATERSHED

PROJECT SITE INFORMATION

| | |
|----------------------|-------------------------------------|
| Land Owner | Culver City Unified School District |
| Street Address | 4100 Irving Pl. |
| Latitude / Longitude | 34 01 20.30N - 118 23 35.0W |

SITE DESCRIPTION

Linwood Elementary School is located in the northern portion of Culver City. This project presents opportunities to combine MS4 Phase II water quality requirements for school districts with multi-benefit water quality projects.

The concept plan was developed as a modular design for flexible implementation to best fit Culver City Unified School District (CCUSD) and City goals and budgets. The most significant aspect of the project includes a large scale infiltration chamber underneath the field with the potential to mitigate up to 271 percent of the water quality runoff volume from the 5.5-acre watershed. Runoff would be diverted from existing storm drain and pre-treated before being conveyed into the underground storage. BMP1 also includes shallow reservoir above the infiltration storage for irrigation reuse via passive capillary action that could replace 69 percent of the potable water demand from the field. The BMP2 site was identified as an opportunity for converting impervious areas to pervious pavements with underground infiltration storage when pavement replacement projects are planned. The BMP2 site would have the potential to mitigate up to 135% of the water quality runoff volume from the 5.5-acre watershed.

Although not included in this project concept, school buildings could be an opportunity for interior re-use, since rainfall typically occurs during fall and winter months when schools are in session. Another alternative could capture of stormwater for delayed release to sanitary sewer based on proximity to existing sanitary sewer lines.

Culver City Stormwater Quality Master Plan
Priority Concept Project: R7 Linwood Elementary School

PROJECT WATERSHED

SITE DESCRIPTION

Fox Hills Park is located at the southeastern edge of Culver City.

The concept plan includes an underground storage for infiltration under the park, as well as the opportunity to capture and reuse stormwater for park irrigation. The BMP footprint would have potential capacity to capture 100% of the 85th percentile storm event runoff volume from the 38.89-acre watershed.

Stormwater would be diverted from an existing storm drain in Buckingham Parkway. A pump structure would be needed to convey the water from the pretreatment system into the storage chambers. Stored water would ideally be infiltrated, pending geotechnical study and constraints.

Harvested water could also be used for reuse as irrigation in the park, with potential to supply approximately 30% of the potable irrigation demand. Reuses of harvested water for toilet flushing may be considered, pending evaluation of the restroom conditions.

Five dry wells will be installed at the park to provide supplemental infiltration. The actual number and location will depend on site-specific geotechnical conditions.

DESIGN CRITERIA

| | |
|---|------|
| Precipitation, 85 th percentile, 24-hr storm (in) | 1.1 |
| Runoff Volume, 85 th percentile, 24-hr storm (ac-ft) | 2.4 |
| Peak Discharge, 85 th Percentile, 24-hr storm (cfs) | 7.4 |
| Infiltration Rate (in/hr) | 0.25 |

Appendix E – Prioritization

PRIORITIZATION METRICS MATRIX

| Metric | Points | | | | | |
|---|--|---|-----------------------------|---|-----------------------------|------------------------------------|
| | 0 | 1 | 2 | 3 | 4 | 5 |
| PHYSICAL CHARACTERISTICS | | | | | | |
| Regional Stormwater Projects | | | | | | |
| Drainage Area (acres) | Less than 10 | 10 to 20 | 20 to 50 | 50 to 100 | 100 to 200 | 200 or greater |
| Site Slope (%) | 10 or greater | 10 to 5 | | 5 to 2 | | Less than 2 |
| Proximity to Storm Drain (ft) | Greater than 500 | 500 to 200 | | 200 to 100 | | Less than 100 |
| Impervious Area (%) | Less than 40 | 40 to 50 | 50 to 60 | 60 to 70 | 70 to 80 | 80 to 100 |
| Hydrologic Soil Group | D | | C | | B | A |
| Dry Well Projects | | | | | | |
| Drainage Area (acres) | Less than 1 | 1 to 2 | 2 to 5 | 5 to 10 | 10 to 15 | 15 or greater |
| Site Slope (%) | 10 or greater | 10 to 5 | | 5 to 2 | | Less than 2 |
| Impervious Area (%) | Less than 40 | 40 to 50 | 50 to 60 | 60 to 70 | 70 to 80 | 80 to 100 |
| Within Drainage Area of Another Proposed Project | Yes | | | | | No |
| Hydrologic Soil Group | D | | C | | B | A |
| Green Street Projects | | | | | | |
| Site Slope (%) | Greater than 5 | 5 to 4 | 4 to 3 | 3 to 2 | 2 to 1 | 1 or less |
| ROW Width by Street Class | | Narrowest 33% | | Middle 33% | | Widest 33% |
| Utility Constraints | Multiple high conflict utilities | One high conflict utility | | | | No high conflict utilities |
| Within Drainage Area of Another Proposed Project | Yes | | | | | No |
| Hydrologic Soil Group | D | | C | | B | A |
| MULTI-BENEFITS (All Projects) | | | | | | |
| In Neighborhood with Localized Flood Issues | No | | | | | Yes |
| Private Development Project Within Drainage Area | No | | | | | Yes |
| Pollutant Source Areas Drainage area contains at least 10% | Other | Low Density Residential | Transportation | High Density Residential | Commercial | Industrial |
| Co-located With Another City Project | No | | | | | Yes |
| Groundwater Constraints | In contamination area AND depth to groundwater < 10 ft | In contamination area OR depth to groundwater < 10 ft | | Depth to first groundwater 10 – 20 ft | | Depth to first groundwater > 20 ft |
| Disadvantaged Community (DAC) Benefit | Not a benefit to a DAC or Low Income Community | | | Within Sphere of Influence of DAC or Low Income Community 500 ft | | Within Low Income Neighborhood |
| Urban Heat Island Index | | UHII < 20% of Census Tracts | UHII > 20% of Census Tracts | UHII > 40% of Census Tracts | UHII > 60% of Census Tracts | UHII > 80% of Census Tracts |
| Ballona Creek Revitalization | No | | | Within 250' of Ballona Creek | | Within 50' of Ballona Creek |
| EWMP EQUIVALENT VOLUME | | | | | | |
| EWMP Equivalent Volume (AF) | 0-0.05 | 0.05-0.1 | 0.1-0.2 | 0.2-0.5 | 0.5-1.5 | >1.5 |
